## LETTER OF TRANSMISSION TO MINISTER.

To the Hon. W. L. Maokenzie King, C.M.G., M.P.,
Minister of Labour,
Ottawa, Ont.
Sir,-I have the honour to transmit herewith a report by Mr. R. H. Coats, Associate Editor of the Labour Gazette, on the course of Wholesale Prices in Canada during the twenty years from 1890 to 1909, inclusive, prepared in accordance with your direction.

All of which is respectfully submitted.
I have the honour to be, sir,
Your obedient servant,

F. A. ACLAND.<br>Deputy Minister of Labour.

Department of Labour,
Ottawa, May 16, 1910.

## LETTER OF TRANSMISSION TO DEPUTY MINISTER.

To F. A. Acland, Esq.,
Deputy Minister of the Department of Labour, Ottawa, Ont.

Sir,-I have the honour to submit herewith the results of an investigation into the course of Wholesale Prices in Canada during the past twenty years, namely, from 1890 to 1909 , inclusive.

All of which is respectfully submitted.

> I have the honour to be, sir, Your obedient servant,
R. H. COATS,

Associate Editor Labour Gazette.
Department of Labour,
Ottawa, May 16, 1910.

## REPORT

## ON

# WH0LESALE PRICES, CANADA, 1890-1909. 

## INTRODUCTION AND SUMMARY.

The investigation of which the results are embodied in the present report was begun in the opening months lof 1909. Its object, briefly, has been to determine as accurately as possible the nature and extent of the general rise in prices which has occurred during the past few years, to present the material referring thereto after the most approved method, and to accompany the same with other matter not readily accessible for the study of price fluctuations in Canada. Though the results are more complete with regard to some branches of the inquiry than as to others, it has been thought advisable to issue the report at the present time, in view of the very pronounced interest now attaching to all questions appertaining to prices and the cost of living.

## The Recent Rise in Prices.

For some time past, and especially since the beginning of the present century, one of the most important features of the general cconomic situation in Canada has been a rapid and continuous advance in prices and the cost of living. The upward tendency seemed to have reached its highest point in 1907, when prices attained a level unprecedented in many years previously. The financial panic of the autumn of that year operated in arresting this tendency, and in many departments set in motion a recession which extended over 1908. The check, however, proved but temporary: the comparative slightness of its effect and the early recovery of the upward trend constituted in fact an especially noteworthy feature of the stringency in Canada. This became marked with the increasing industrial activity and trade prosperits of 1909, in the closing months of which the high cost of living had become a subject of wide-spread discussion, affecting as it did the immediate personal well-being of nearly every one in the community, especially those of the wage-earning and other classes dependent on fixed incomes. Since the opening of the present year, public interest has been still more intense, a large number of the trade journals and daily newspapers of the country having published articles dealing with the question in greater or less detail, while a number of investigations of varying character into the nature and causes of the rise have been made by public and private initiative. At the present time it is safe to say no economic question equals in public interest that of the recent rise and the existing high level of prices. "When the history of 1910 comes to the written,' says one of the most recent and authoritative writers on the subject," ' not the least memorable of its happenings to be chronicled will probably be the great agitation. partaking of the proportions of a national revolt, against the high prices of food.'

In the United States, with which so many problems of this kind in Canada are intimately shared, the situation has apparently been even more acute than in this country. Public feeling arose to such a pitch during January last, that n systematic boycott against the use of meats was undertaken in several localities, in which thousands of people joined. Congress has instituted nu investigntion into the general subject of prices, and several of the State legislatures have taken action in the matter.

[^1]The movement extended to Canada, and the feasibility of a similar boycott was discussed at several points in Ontario, the object being primarily by way of protesting against what was felt to be an undue enhancement in the price of many of the most important commodities entering into the cost of living.

## Genesis of the Inquiry.

It has been the primary object of the present investigation to measure as aecurately as possible the extent of the changes in Canada so fraught with importance to the community. Before the discussion of a situation of the kind is feasible, it is necessary to define it, both as a whole and in its component parts. This is especially necessary before any attempt towards remedial treatment, of which so much has been heard recently, is possible. Heretofore no comprehensive effort has been made to measure the extent of price fluctuations in Canada or to give the subject a proper breadth of view.

This special object of the report has been carried out in such intimate connection with the general statistical work of the Labour Gazette, with regard to prices, as to warrant a word of explanation of its relation to that work as a whole.

The Labour Gazette has for some time past dealt in a general way with prices in the monthly review of industrial and labour conditions throughout Canada published as the leading article in each issue. In this article a paragraph has been devoted to a brief mention of the more important price changes reported in the preceding month. Prices have been regarded in this statement in a twofold light: (1) as indicating tendencies in the cost of living; and (2) as reflecting current industrial and trade conditions. For the former purpose, retail prices, which represent the actual cost of goods to the consumer, are the more suitable; for the latter, wholesale prices, including those of important raw materials, being much more sensitive than retail to passing sentiment, form the better barometer.

The unsatisfactoriness of general statements in such a matter led the department some time ago to design a more comprehensive and systematic means of treating the subject of prices in this monthly summary. It was decided to deal henceforth with wholesale and retail prices separately. As the latter depend largely on local conditions, quotations for over thirty staple commodities entering largely into the cost of living (including foods, fuel and lighting, to which rentals are added) are to be obtained monthly from forty-eight important idustrial centres throughout the Dominion. This, it is thought, will cover adequately the cost of living aspect. $\dagger$ With regard to wholesale prices, a list of two hundred and thirty articles, representing the most important departments of Canadian production and trade, was carefully compiled; and quotations for each article will be obtained from month to month in the governing or representative wholesale market-the whole to be combined and analysed in accordance with statistical practice.

The present investigation represents the carrying backward into the past of this second division of the subject, namely, the portion relating to wholesale prices. A part from the special interest attaching to such an inquiry at the present moment, the method of presentation proposed rendered action of the kind necessary in order to obtain a proper basis on which to establish a comparative record of future prices. The investigation into past conditions, though confined to wholesale prices, will serve at the same time to indicate tendencies in cost of living, for though wholesale prices fluctuate much more frequently and violently than do retail, their accessibility and reliability render them the medium usually chosen for the purposes of an inquiry into cost of living.

## General Plan of the Investigation.

The investigation was limited to the past twenty years (1890-1909) owing to the fact that it was found possible within that period to go back some distance prior to the time at which the recent rise in prices began and thus to obtain a sufficiently

[^2]detached point of view. Records within these limits are on the whole easily accessible, but tend to become scarcer and less reliable as the review backward is extended.

The general plan followed in the inquiry was, to select a comprehensive list of representative staple commodities, and to trace the course of prices for each from month to month back to 1890 . With this material as basis, an interpretation and measurement of the movement of prices, both as a whole and in the more important departments of trade, has been attempted.

## Commodities Included.

The first step in the inquiry proper was to determine what commodities should be included. The object being to obtain a result representative of cost of living and the industrial life of the community as a whole, the plan was to embrace as many as possible of the main staple articles of Canadian production and consumption consistent with the avoidance of duplication and the preservation of proportion as betweer: the several divisons into which the inquiry fell. Manufactured articles as well as raw materials were introduced, though specialized lines were avoided. Choice was in some branches limited by the difficulty of securing continuous quotations of certain articles, and it is hoped to add a few commodities ( $\ddagger$ ) to the investigation as carried forward into the future. On the whole, however, the list is a comprehensive one, and the items have been carefully distributed. It is thought that the selection in this respect will compare with those of the well-known price records maintained in other countries and will fulfil the accepted canons of statisticians. The number of articles included, namely 230 , is much larger than in the great majority of similar investigations.

The commodities have been arranged, for the purposes of the inquiry, in thirteen general groups, as follows:-

The above grouping may, of course, be varied for special purposes, and has been so varied in analysing the returns so as to show the movement of all products of the farm, all foodstuffs, all manufactured products, \&c.

[^3]A complete list of the commodities covered in the report, showing the unit of measurement quoted in each case and the wholesale market at which the quotation was obtained, is given, for convenience or reference. in the following table.

List of Commodities included in the Investigation, with Units of Measurement and Wholesale Markets at which Quotations were Obtained.

List of Commodities included in the Investigation, with Units of Measurement and Wholesale Markets at which Quotations were Obtained-Continued.

List of Commodities included in the Investigation, with Units of Measurement and Wholesale Markets at which Quotatations were Obtained-Continued.

List of Commodities included in the Investigation, with U'nits of Measurement and Wholesale Market at which Quotations were Obtained-Continued.

List of Commodities included in the Investigation with Units of Measurement and Wholesale Markets at which Quotations were obtained-Concluded.

The considerations governing the choice of the articles will be apparent from the list itself. The consumption standard has formed the basis of selection; but the aim has been to reflect production and general trade as well. For example, under the heading 'grains and fodder' the main products of the chief agricultural prorinces, whose prices either rule or reflect conditions for the whole of Canada, are taken. Under the heading 'fish' the more important products of the three great divisions of the Canadian fisheries, viz., the fisheries of the Maritime provinces, the fisheries of the great lakes of the interior, and the fisheries of the Pacific coast, are included. In lumber, staple products of the New Brunswick, Quebec, Ontario and British Columbia forests will find a place. Under textiles, quotations of woollens, cottons, linens, silks, jutes and oilcloths are given, the first-mentioned group being represented by quotations of wool, washed and unwashed, a typical Canadian yarn, a typical all-wool woven fabric and a typical knitted product. Under 'other foods' the wholesale grocery and provision trade of Toronto and Montreal are reflected. Similarly with metals, meat products, leathers, house furnishings, chemicals and the rest.

## Sources of Information.

For each of the above 230 commodities an effort was made to secure a reliable price quotation in a primary or representative wholesale market for the opening week day of each month in each year back to 1890 . The daily press and weekly trade journals of the country, the printed reports of Exchanges, Boards of Trade, \&c., were the first sources laid under contribution. Toronto and Montreal markets furnish the great mass of the quotations. The records thus obtained were verified by reference to long-established and favourably known business firms dealing in the articles in question. Where reliable printed matter failed, the books of manufacturers and wholesalers were by courtesy of the owners consulted, and some valuable data obtained. Monthly quotations were not in all cases considered necessary, as in the case of articles of which the prices are fixed at considerable intervals, and in a few other cases were not available; here yearly averages, based in each case on expert opinion, were secured. Seventeen of the 230 series of quotations represent annual averages obtained in this way. It may be added that every care has been taken to insure that the prices quoted for each article represent a uniform quality and uniform conditions of sale throughout. Where qualities and terms of sales are not specifically mentioned, it is to be assumed that the price represents the cash price for the highest grade in large lots. Where, also, more than one authority is drawn upon in a single table, special precautions were taken to insure continuity of quality. For the rest, the reader will find in the several table of prices which follow later on in the report, full information as to the sources of each item.

## An Index Number Constructed.

A word of explanation is necessary as to the method employed in analyzing and interpreting the results found as above. This is the well known method of index
numbers. The object of an index number is to show the combined or final effect of several price changes. The nature and extent of changes in the price of a single commodity may be seen at a glance by the inspection of a series of actual price quotations. Suppose, however, the price of Ontario wheat advances within a given period, say, ten cents a bushel, while the price of New Brunswick spruce lumber declines, during the same period, say, three dollars per thousand feet-how may the net result of the two changes be expressed? The answer is, by reducing the actual price quotations in each case to the form of a percentage of the price during a common standard period, (i.e., translating the quotations into the terms of a common denominator) in which form they may be combined. This, in effect, is the method of i:idex numbers. An index number of any article or number of articles at any date is the percentage which the price of that article or number of articles at that date is of the price of the same article or articles at another date or period selected as a standard.

In the present investigation the period selected as the base or standard period is the decade 1890-1899. When it is stated, therefore, that the index number of lard in 1909 is 161.3 , the meaning is that the average price of lard in 1909 was 61.3 per cent above the average price of that commodity during the decade 1890-1899. When. similarly, it is said that the index number of 'grains and fodder' for 1909 is 149.9. the expression simply means that, combining and averaging the 1909 prices of th. thirteen products included in that division of the investigation, the result shown is 49.? per cent higher than the result for the decade 1890-1599. Again, when it if said that the department's final index number for 1909 is 127.5 , the meaning sought in be conveyed is that the prices of the 230 commodities included in the whole in-:o-tigation show, when reduced to an average, an increase of 27.5 per cent compured with the average level of prices during 1890-1899.

As the calculation of an index number is a technical process, a description of the method followed in the present report has been reserved for an appendix, to which the reader is referred for details as to the manner of combining the price statistics. considerations influencing the selection of the base period, the reckoning of the average, \&c.

By the publication of the index number established in the present report from month to month in future, the department will be able to supply an analysis of current prices in Canada similar to that furnished by the London Economist's index number in the case of Great Britain, or the index numbers of Dun and Bradstreet in the United States. The need for such contemporary analysis is obvious. It is true that for many of the most important Canadian products the price is fixed in the world-market, and the index numbers of other countries accordingly apply to a degree here; yet the rapid development of the Dominion and the differentiation in conditions implied thereby have created a demand for independent statistics. For example, it has been asserted that the effects of the financial stringency of 1907 were less severe an prices in Canada than in the United States. Yet do meaus of statistical comfurison on broad lines has hitherto been available.

## Arrangement of Material.

In presenting the statistics obtained as above, with an analysis of the sane, the arrangement of the report is as follows:-

The subject matter has been divided into three parta- 10 which the present statement may serve as introduction-with an appendix:-

Part 1.-In the first part of the report, the records of actual price quotations obtained are given. These represent the complete hody of statistical matter secured in the cave of each commonlity and form the gromed wark of the whole report. The tables follow the same grouping and order as in the list above. the commodities being arranged alphabetically within the several divisione. Full detaits are given at the head of each table of the source of the statistics. exact guality of the article quoted, \&c. The average price for each year is also shown.

Part II.-Following the tables of actual prices, a series of tables is given in which the average annual prices shown in Part I. are expressed in the form of index numbers. This enables the price fluctuations of the several commodities from year to year to be compared on a similar basis and to be combined so as to show the movement of related groups. An index number is cुiven for each commodity, for each of the several divisons and subdivisions indicated in the list of commodities, and for certain other groupings.

Part III.-In the third division of the report a series of charts is published which will show at a glance the more important features of the price movement of the past trenty years. These charts are based on Parts I. and II., and are self explanatory.

Appendix.-The appendix to the report is in three parts: (1) $A$ description of the technical problem involred in the construction of the index number. (2) A revien of the more celebrated index numbers of Great Britain and foreign countries, with tables and diagrams of the results which they severally show, the whole being given in illustration of the problem described in the first part and as of direct interest in connection with existing conditions in Canada. (3) A statement as to the causes and effects of price variations with special reference to existing conditions in Canada. and the character of the data necessary to determine the same with exactness.

In the immediately following portion of this introduction a summary is given of the leading results shown by the investigation and set forth in detail in the tables and charts of parts I, II, and III of the Report.

## General Result of the Investigation.

The net result of the investigation is perhaps most clearly indicated by the chart which forms the frontispiece of the present report, in which the line indicates the course which the averaged prices of all commodities included in the investigation followed from 1890 to 1909 , inclusire. The level indicated by the number 100 in the table represents the average price of the commodities during the decade 1890-99.

The aggregate index number on which the chart is based is shown in the table published on the following page, which also contains from rear to rear the index numbers for the several groups into which the commodities are divided.

On referring to the table and chart, the reader will see that prices in Canada followed a downward course from 1890 to 1897. This was succeeded during the ensuing decade by a more rapid upward movement which culminated in 1907. The last mentioned year was by a considerable margin the highest point in the twenty vear period. Prices fell in 1908, but were upward again in 1909.

Comparing the more important points in this progress with the average level of prices during the decade 1890-1899, it will be seen that in 1890 prices were somewhat over 10 per cent above that average. In 1897, after three years of panic depression and political unrest in the United States and Canada, they had fallen to a point nearly 8 per cent below. Within six years thereafter, however, they regained this loss. Continuing to mount with extreme rapidity, in 1907 they reached a point over 26 per cent above the average of the base decade. The recession in 1908 amounted to nearly five points. During 1909 this recession was checked and a gain in the opposite direction registered.*

Comparing the high year 1907 with the low year 1897 the advance amounted to approximately 37 per cent. Comparing the year 1909 with the low year 1897 the increase shown is approximately 31.5 per cent.

Referring to the several groups, it will be seen that the chief advances occurred in lumber, grains and fodder, animals and meats, furs, hides and leather, paints.

fish and dairy produce. None of the other groups show a decline compared with the base decade, but metals and implements, fuel and lighting, and drugs and chemicals are but slightly above the average of 1890-1899. Somewhat larger advances are shown by textiles, fruits, groceries, house furnishings, miscellaneous building materials, and liquors and tobaccos.

## Experiment with Weighted Averages.

In arriving at the above conclusions, the simple average of the prices of all the commodities covered in the investigation was taken. In other words the several commodities of the list were regarded as of equal importance from the standpoint of the consumer. This, of course, is not true to the fact. Wheat is of vastly greater importance in consumption than, say, pepper. For considerations, however, which are regarded by competent authorities as sufficient, and which being largely of a technical nature are explained in detail in the appendix, the method of taking a simple arerage may be relied upon, in an investigation covering so many commodities as the present, to show an accurate result.

By way of ascertaining whether any material change would be involved by the employment of weighting (that is, the giving to the several commodities an importance approximately equal to their importance as entering into consumption) the following experiment was made. It was found impossible, within the time available, to construct a series of weights for the several commodities; but the table suggested by the British Association for the Advancement of Science, a committee of which dealt exhaustively with the whole subject of index numbers in 1887-1890, was applied, with some slight modifications, to the several groups of the present investigation, for the purpose of offsetting any undue preponderance given to articles of minor importance by the method of selecting and grouping. The weights as thus applied are as follows:-*

In accordance with the above, the grains and fodder group index number was given in the calculation eighteen times the importance of those of implements, paints, and furs, nine times the importance of those of liquors and tobacco and house furnishings, \&c. Similarly, textiles were given four times the importance of hides, leather

[^5]and boots and shoes, while general groceries and provisions were given double the importance of dairy produce and six times the importance of fish. The numbers obtained, placed for convenience of comparison beside the simple-average numbers, are as follows:-

|  | Year. | Weighted Number. | Unweighted Number. |
| :---: | :---: | :---: | :---: |
| 1890 |  | 112.0 | $110 \cdot 3$ |
| 1891 |  | $111 \cdot 3$ | 108.5 |
| 1892 |  | $104 \cdot 9$ | $102 \cdot 8$ |
| 1893. |  | $103 \cdot 9$ | 102.5 |
| 1894. |  | $37 \cdot 2$ | 97:2 |
| 1895. |  | $95 \cdot 6$ | $95 \cdot 6$ |
| 1896.. |  | $90 \cdot 6$ | 925 |
| 1897 |  | $89 \cdot 9$ | $92 \cdot 2$ |
| 1898. |  | $95 \cdot 5$ | $96 \cdot 1$ |
| 1899.. |  | $99 \cdot 0$ | 1001 |
| 1900 |  | $105 \cdot 8$ | 108.2 |
| 1901 |  | 106.0 | 107.0 |
| 1902 |  | $109 \cdot 6$ | 109-0 |
| 1903. |  | 10.7 | 110.5 |
| 1904 .. |  | 1106 | 1114 |
| 1905 |  | 113.8 | 1138 |
| 1906 |  | 120 ' | $120 \cdot 0$ |
| 1907 |  | 1292 | $126 \cdot 2$ |
| 1908 |  | $125 \cdot 1$ | 120'8 |
| 1909. |  | 126.3 | 1212 |

The result is shown graphically in the following chart, the black line representing the simple-average number and the dotted line the number obtained by weighing the groups:-

COURSE OF WHOLESALE PRICES, CANADA, 1890-1909.

The fluctuations of the weighted average are somewhat wider than those of the simple-average, both in an upward and a downward direction. Beginning on a higher level in 1590, the number drops somewhat lower in 1897, the low year, and rises somewhat higher in 1907, the high year. The recession in 190S, however is less pronounced, and the recovery in 1909 slightly more rapid. In brief, there is a fall amounting to 23.1 points shown between 1890 and 1897 , instead of 15.1 points as shown ty the simple-average number, while the rise from 1807 to 1907 amounts to 43 per cent instead of 37 per cent. Comparing 1909 prices with the base decade and the low year, the gains shown by the weighted number amount respectively to 26.3 per cent and 40 per cent, whereas the simple-average number shows the gains to be respectively 21.2 per cent and 31.5 per cent.

## Number of Articles Showing an Increase or Decrease in Price.

An indication, less specific than the above, of the general course of prices during the period, may be obtained by noting the number of articles which show an increase or decrease in price in the final year, as compared with the period selected as the standard (1890-1899) and the more important turning points in the line. The following table gives a summarized comparison on this basis, of prices in 1909 with (1), average prices for the base decade; (2), prices during the year 1890; (3), prices during the low year, 1897, and, (4), prices during the high year, 1897 :-

Number of articles showlig an licrease or decrease in price in 1909.

| Compared with 1890-1899. |  |  | Compared with 1890. |  |  | Compared with 1897. |  |  | Compared with 190\%. |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Inc. | Dec. | No Change. | Inc. | Dec. | No Change. | Inc. | Dec. | No Change. | Inc. | Dec. | No Change. |
| 160 | 58 | 4 | 129 | 82 | 6 | 176 | 42 | 3 | 90 | 109 | 31 |

The above shows that, comparing average prices in 1909 and 1897, four articles advanced for every one that declined. When the comparison is between 1909 prioes and those of the base decade, about three times as many advances as declines are shown. As between prices in 1909 and in 1890, half again as many articles show an advance as those which show a decline. Compared with the high year 1907, the decline in the general average was caused by decreases in 109 articles, i.e., less than half of the total number, while 90 articles advanced in price, some 31 showing little or no change.

A similar comparison, with the year 1907 as basis, is shown in the following:-
NUMBER OF ARTICLES SHOWING AN INCREASE OR DECREASE IN PRICE in $190 \%$.

## Comparative Level of Prices in 1909

The general level of prices in the several groups in 1909, expressed in percentages of increase or decrease, as compared (1) with 1890, (2) with the decade 1890-1899, and, (3) with the low year in the respective groups, is shown in the following table:
percentage of increase shown by prices in 1909.

| Group. | Compared with 1890. | $\begin{gathered} \text { Compared } \\ \text { with } \\ \text { decade } \\ 1890-1899 . \end{gathered}$ | Compared with the low year. |
| :---: | :---: | :---: | :---: |

Diagram Showing Comparative Extent of Increase of Prices by Groups in 1909 over Average for 1890-99.

## High and Low Prices.

In order to show at a glance the extreme range of actual prices in the case of each commodity the table published on the next and following pages of the highest and lowest prices shown for each has been compiled from the detailed tables of Part I. of the report.

Reckoning by yearly averages, the following table shows the years in which more than ten commodities reached their highest level:-

|  | Year. | $\substack{\text { Number } \\ \text { of } \\ \text { Commoditie*. }}$ |
| :---: | :---: | :---: |
| 1909 |  | 55 |
| 1907. |  | 36 |
| 1908 |  | 30 |
| 1890 |  | 27 |
| 1891. |  | 15 |
| 1906 |  | 14 |
| 1900. |  | 11 |
| 1904. |  | 10 |

The years showing the largest number of commodities on their lowest levels are as follows:-

|  | Year. | $\begin{gathered} \text { Number } \\ \text { of } \\ \text { Commodities. } \end{gathered}$ |
| :---: | :---: | :---: |
| 1897. |  | 33 |
| 1895 |  | 29 |
| 1898. |  | 23 |
| 1899. |  | 18 |
| 1894 |  | 18 |
| 1895 |  | 17 |
| 1890. |  | 17 |
| 1892. |  | 12 |

+ These quotations are taken from the tables published in Part I of the Report. As the prices in the latter are for the most part those only of the opening market day in each month, it is possible that both lowar and higher points were actually reached than are shown in this table.

## Results by Groups and Commodities.

The following is a brief review of the more important changes shown during the past twenty years in the several groups and commodities*:-

## I.-Grains and Fodder.

The index number for the thirteen commodities grouped under the heading 'Grains and Fodder' shows that, on the whole, prices were 49.9 per cent higher in 1909 than the average prices of the decade 1890-1899. The past year saw prices on a higher level than at any time in the twenty year period, though the increase from 1908 was but slight. Prices were lowest in 1897, but were higher in 1890 and 1891 than at any other time in the twenty year period with the exception of the last four years. Compared with 1897 , prices of grains and fodder are now approximately $87 \frac{1}{4}$ per cent higher.

[^7]Barley, western, malting.-Western barley was higher at Winnipeg, Man., in 1890 than in any year since, though prices in the past year were approaching the previous high level. The lowest price recorded was 20 cents per bushel, in November, 1895, and the highest, 65 cents per bushel, April-June, 1890. The year 1896 saw the prices during 1909 were 45 per cent higher; compared with 1897 the remarkable in1909, 51.77.

Barley, No. 2. Ontario.-For Ontario barley the lowest year was 1897 (2s.23c.) and the highest, 1908, ( 60.73 c .), with 1907 and 1909 rery close upon the latter. Prices, however, were relatively high in 1890-1891. Compared with the decade 1890-1899, prices during 1909 were 45 per cent higher; compared with 1897 the phenomenal increase of 134 per cent is shown.

Bran.-Bran prices show a range from $\$ 7$ per ton in October, 1596 , to $\$ 24$ per ton in April, 1909. The average price for 1897 , the low year, was $\$ 7.85$, and for 1909 , the high year, $\$ 22.02$. In other words prices have advanced over 180 per cent in the last twelve years. Compared with the decade 1890-1899, the prices of 1909 show an advance of 82.2 per cent.

Corn, No. 3, yellow.-The year 1908 shows the highest average price for corn, viz.. 76.08 c ., with 1909 second with 72.28 c ., and 1891 third with $70 \cdot 31 \mathrm{c}$. The lowest year was 1897 , when corn averaged about 26 c. per bushel. The adrance shown by the 1909 prices is 64.6 per cent compared with the decade $1890-1899$ and over 180 per per cent compared with the lowest year, 1897.

Hay No. 1.-The highest price recorded for hay was in 1907 when $\$ 18$ per ton was reached. The lowest price quoted is $\$ 5.50$, in March, 1899 . Hay was 35 per cent above the average of the decade 1890-1899 in 1909, 45.4 per cent above in 1908 and $59: 3$ per cent above 1907. The lowest year was 1894 , when prices were 18 per cent below the average for the decade. The high price of fodder in 1907 is held responsible in part for subsequent high meat prices, farmers reducing stocks and thus curtailing the supply.

Oats, No. 2, white, western.-As in the case of western barley, oats reached their highest level in 1890 with an average of 42.33 c. per bushel. Since that year, oats have passed 40 c . as a yearly average only in 1901, 1907 and 1909. The lowest price recorded is $16 c$. per bushel, in December, 1895, and in the opening months of 1896. The highest quotations are 55c. in August, 1890, and 54c. in July, 1909. Prices were one-third higher in 1909 than in the decade 1590-1899, and approximately double the prices of 1896.

Oats, Ontario, No. 2, white.-The range of prices shown is from 1ic. per bushel in February, 1897, to 60c. per bushel in June, 1909. The highest years were 1909, 1908. 1907 and 1891 , when prices were respectively $45.27,44.52,43.50$ and 42.45 c . The lowest years were 1896 and 1897, with an average price of a little over 20 c. per bushel. Prices were approximately 50 per cent above the average for the decade 1590 1699 in 1909, and approximately 31 per cent below that average in 1596 and 1897. The rise since 1896 amounts to approximately 115 per cent.

Peas, Ontario, No. 2.-In peas, an equal or greater increase has taken place, 1909 prices being 58 per cent above those of the decade $1890-1899$, and 110 per cent above those of 1897 , the lowest year shown. The highest quotation recorded was in May, 1909 , namely, 96c. per bushel, and the lowest in June, 1597, namely, 38c. per bushel.

Rye, Ontario, No. 2.-In rye the range was from 31 cents in July, 1597, to 88 cents in June and July, 1908. The index number showed prices 40 per cent higher in 1909, and 28 per cent lower in 1897, than in the decade 1890-1899. The higheat arerage year was 1908 , and the second highest 1891; in the latter, prices were 40.7 above those of the decade. The year 1902 was also a high year, but prices fell immediately thereafter, and did not regain the same level until 1906.

Shorts.-The fluctuations in shorts are similar to those of bran. The loweat price quoted is $\$ 8$ per ton in the closing months of 1896 and the opening months of 1597, while the highest prices recorded, namely \$26, occurs in November, 1907. By
average yearly prices, a fairly high level was maintained from 1890 to 1895; in 1896 and 1897, however, there was a very decided decline, followed by a partial recovery in 1898 and 1899. The level was further increased during the ensuing five years, and in 1907 rose rapidly. In 1909 prices were 62 per cent above the average for the decade 1890-1899, and 130 per cent above the prices of the lowest year, 1897.

Straw, baled.-Baled straw was 33 per cent above the average for the decade 18901899 in 1909. The 1909 prices were lower by nearly 2 per cent than those of 1907 and by nearly 8 per cent than those of 1908. Compared with the low jear, 1898, prices were over 70 per cent higher in 1909. The lowest quotation shown is $\$ 4$, from July to October, 1898, and the highest $\$ 10.50$, in the closing months of 1907 and the opening months of 1908.

Wheat, No. 1, northern.-This grade of wheat was 40.5 per cent above the average of 1890-1899 in 1909, this being the highest level reached. The lowest was in 1894. with prices 20.8 per cent below the average for the decade. The range of actual prices shown in the table is from 54 cents a bushel in October, 1894 , to $\$ 1.323$ per bushel in July, 1909. The next highest price quoted was $\$ 1.28$ in May, 1898. By yearly averages, the price rose from 84 to 93 cents between 1890 and 1891, then dropped to 61 cents in 1894, rising to 93 in 1898, but dropping to $70-80$ during the next five years. In 1904 and 1905, the average passed 90 cents; but in 1906 and 1907 they fell below this level, rising, however, in 1908 and 1909 to $\$ 1.03$ and $\$ 1.08$ per bushel respectively.

Wheat, Ontario, No. 2, white.-The lowest price appearing in the table for Ontario wheat is 52 cents per bushel, in September, 1894. The highest is $\$ 1.40$, in June, 1909. The price passed $\$ 1$ per bushel during certain months of 1891, 1898, 1904, 1905, 1907 and 1909, but there is only one year, namely, 1909, in which the average for the twelve months exceeds $\$ 1$. Prices during 1909 were 43 per cent higher than in the decade 1890-1899 and over 87 per cent higher than during 1894.

## II.-Animals and Meats.

The animals and meats group is made up of cattle and cattle products, hogs and hog products, sheep and sheep products, and fowls and turkeys. It includes a total of 14 series of quotations. Combining all, it is shown that prices in 1909 were 48.6 per cent above the prices of the decade 1890-1899. The next highest year was 1907, when prices were 33.8 per cent above the ten year period mentioned. The lowest year was 1896, when prices were 17.6 per cent below the average of the base decade. From 1897 to 1909, therefore, there was a rise of approximately 80 per cent in the price of meat products in Canada.

Contributing to this result, cattle and cattle products and hogs and hog products showed approximately the same variations as the list taken as a whole. The price of fowls and turkeys, however, during the last two years has been very rapidly upward, while sheep and mutton prices, though varying above the average for the base decade, have been less markedly upward, and since 1907 have been falling.

Bacon.-Bacon, which sold as low as 8c. per pound in April, 1896, touohed 18c. in 1906 and 1909. The average yearly price, which was 10.6 c . in 1890 , rose to 12 c . in 1893, fell to 8-9c. in 1896, rose again to 12.1c. in 1900, reached its highest point in 1906 with 16.2 c., and fell to 15.4 c. in 1909. Compared with the decade, 1890-99, the price of bacon was 46 per cent higher in 1909; compared with 1896, the lowest year, the price in 1908 was 71 per cent higher.

Beef and veal, dressed.-The record for these is complete only from 1903, since when there has been an almost continuous rise, amounting to 44 per cent in the case of the former and to 29 per cent in the case of the latter.

Cattle, western, prime.-Western cattle prices show a range from $\$ 2.50$ per cwt. in November and December, 1903, to $\$ 6$ in July, 1907. The highest yearly average price shown is $\$ 5.354$ per cwt., in 1902 ; the next highest is $\$ 4.625$, in 1908. The lowest is $\$ 2.687$, in 1894 . In 1909 , western cattle prices were 12.4 per cent above the
average for the base decade; in 1907, however, they were 20 per cent above the average, and in 1892, 45.5 per cent above.

Cattle, butchers' choice steers.-Prices of Ontario cattle have been less violent in their fluctuations than those of western cattle, though they have reached relatively higher levels. The highest point recorded was in 1909, in which year prices were $47: 5$ per cent above those of the decade, and over $\$ 0$ per cent above those of 1896 , the lowest ycar. The lowest quotation recorded is $\$ 2.75$ in October, 1896 , and the highest, $\$ 6.40$, in June and November, 1909.

Fowls and turkeys.-The lowest price shown for fowls and turkeys was 4c. per lb . for the former and 7 c . per lb . for the latter. The highest prices were 15 and 19 c . respectively, both occurring in 1909. Fowls were 88 per cent higher in 1909 than in the base decade; turkeys were 85 per cent higher. The low jear in the case of fowls was 1897, and in the case of turkeys, 1896, in which prices were respectivels 18 and 19 per cent below the respective arerages for the decade. The rise in poultry represented by the prices of 1909 amounted to approximately 130 per cent compared with the low period, 1896-1897.

Hogs, select, and hogs dressed.-The price of live hogs was approximately 52 per cent higher in 1909 than in the decade 1890-1899, and approximately 87 per cent higher in 1909 than in 1896, when the lowest yearly average was shown. Actual prices show a range from $\$ 2.75$ per cwt. in July, 1896, to $\$ 8$ in September, 1909. Dressed hogs between 1903 and 1909 ranged from $\$ 6.55$ in February, 1904, to $\$ 11.50$ in September and October, 1909. The lowest year in the record was 1904, when the average price was $\$ 7.193$; the highest year was 1909 , when the average price was $\$ 10.532$ per cwt.

Hams, sugar cured, medium.-Hams have been very high since 1006, the level since that date being about 30 per cent higher than during the decade 1S90-1599. Compared with 1896, the lowest year shown, prices were approximately 50 per cent cent higher. The range in the quotations is from $7 \frac{1}{2}$ per lb . in August, 1906, to 1 Sc . per lb. in November, 1909.

Lard, pure, in tierces.-The lowest price shown for lard is 6 fc . per lb. in August, 1896; and the highest $15 \frac{1}{2} \mathrm{c}$. per lb . in Norember and December, 1909. The average price during 1909 was 13.8 c . The average price in 1899 was 6.687 c . Lard prices in 1909 were over 60 per cent higher than in the decade 1890-1899 and over 93 per cent higher than in 1896.

Pork, heavy Canada, short cut mess.-Salt pork per barrel sold for $\$ 10$ in December, 1596; it reached $\$ 31$ per barrel in October and December, 1909. From 1890 to 1892 the average price was between $\$ 16$ and $\$ 17$; in 1893 , however, it rose to $\$ 21.77$. but fell back to $\$ 12.31$ in 1896; it did not pass the record of 1893 until 1902, when the highest yearly average in the table, with the exception of that for 1907 ( $\$ 23.31$ ), namely, $\$ 23$, is shown. For 1909, the average was $\$ 25.58$, that is, 57.1 per cent above the average for the decade 1890-1899, and 198 per cent above the low year, 1596.

Sheep, export ewes, and mutton dressed.-Export ewes were higher in 1890 than in any year since. As high as $\$ 7.50$ per cwt. is recorded in the table for that year. Prices fell thereafter, until in 1896 a quotation of $\$ 2.50$ is reported. The highess year since 1890 was 1909 , when prices averaged $\$ 4 . \% 0$, the highest single quotation being $\$ 6$ in May. The index number shows prices in 1909 as on the same level an during the decade 1890-1899, the high years being 1890 and 1891, with a considerable upward tendency in 1906 and 1907. Dressed mutton adranced steadily from 1903 to 1907, but has since declined, though still over 25 per cent higher than in 1803.
N.B.-The packing house business, other than for the curing of pork producta, is a recent development in Canada. Prior to the past few years the dressed meat trado could scarcely be said to exist. In Toronto, the fresh meat for the city was killed in a municipal abattoir which was conducted as a killing concern only, wholesale butchers buying their cattle on the market and paying a fee for having them killed. For this reason prices shown in the investigation for dressed beef, veal, hogs, and mutton,
begin with the year 1903. The influence on prices of the later method of disposing of these meat products has been widely discussed, especially in western Canada.

## III.-Dairy Produce.

Dairy produce, including milk, butter, cheese and eggs, was approxinately 33 per cent higher in 1909 than in the decade 1890-1899. The 1909 prices represent a recession of about 3 per cent from those of 1908 . The low years were 1896 and 1897, since when there has been an advance of approximately 48 per cent. The beginning of the recent rise occurred in 1905.

Butter.-Two varieties of butter are covered in the returns, namely, creamery prints and dairy solids. Their fluctuations, it will be seen, do not run on exactly parallel lines. Creamery prints were lowest in 1897, though the lowest quotation recorded, namely 14c. per lb . was in March, 1895. The highest year was 1908, the highest quotation being 32 c . per lb ., recorded in April of that year. Dairy solids were lowest in 1896 and highest in 1908; the lowest individual quotation, namely, 10c. per lb., however, was recorded in May, 1599, and the highest, 26c., in April, 1907. Creamery prints in 1909 were 20 per cent above the average for the base decade, while dairy solids were 24 per cent above that average. The former show an increase of approximately $33 \frac{1}{3}$ per cent, and the latter an increase of approximately 50 per cent, during the past twelve years.

Cheese.-The price of western coloured cheese has ranged from 7c. to 14c. per lb. during the past 20 years, the low price occurring in 1896 and the high in 1907. Compared with the decade, 1890-1899, cheese prices were 24.4 per cent higher in 1909; compared with 1898, the lowest average year, they show an advance of 45 per cent.

Eggs, storage.-Eggs show the most rapid advance of any commodity in this group. In 1909 they were 71.5 per cent above the average for the decade 1890-1899, and 92 per cent above the average for 1896 , the low year.

Milk.-The wholesale price of milk at Montreal, the largest city in the Dominion, was taken as a fair indication of general conditions. In 1909 prices were 27 per cent above those of the decade 1890-1899. Prices were still higher in 1908, when an advance of 35.7 per cent was shown over the base decade. Prices were unchanged throughout 1890-1899, on a lower level than have since been recorded.
IV.-Fish.

In dealing with fish, the object was to obtain quotations for representative products of the three leading divisions of the Canadian fisheries, namely, the Atlantic fisheries, the fisheries of the great lakes of the interior and the Pacific fisheries. As representing the first division the following kinds were taken, namely, cod-fish, haddock, halibut, herring, lobsters and mackerel; as representing the second division, salmon, trout and whitefish were taken; and, as representing the third division, canned salmon. These are also fairly representative of Canadian consumption.

It will be seen that fish prices in 1909 were over 30 per cent higher than during the ten year period, 1890-1899. Compared with 1902, when fish products appear to have been on lower levels than at any other time of the twenty year period, an advance of approximately 45 per cent is shown.

The tables and charts of the products of the Atlantic fisheries will show at a glance the main fluctuations in prices. The low year was 1892 and the high year 1909.

Canned lobsters.-In connection with the pronounced upward tendency of canned lobsters, namely, an increase of 59 per cent compared with the base period and of over 75 per cent compared with 1890-1895, the following comparative statement of the prices of live and canned lobsters, both furnished by the same shipping company, is of interest:-

|  | Year, | Lobsters, market size, per lb. | Lobsters, canned, per lb. |
| :---: | :---: | :---: | :---: |
| 1890 |  | 80.08 | 80.20 |
| 1892 |  | 0.08 | 0.20 |
| 1893 |  | 0.081 0 0 | 0.30 |
| 1894. |  | ${ }_{0}^{0} 0.092$ | 0.20 |
| 1895. |  | 0.09 | 0.20 |
| 1896. |  | 0.09 | 0.25 |
| 1897. |  | 0.09 | 0.25 |
| 1898. |  | 0.09 | 0.25 |
| 1899. |  | 0.09 | 0.25 |

It will be seen that while the price of live lobsters have increased 50 per cent, that of canned lobsters has advanced 75 per cent.

Salmon trout and whitefish.-Salmon trout and whitefish show a range from $4 c$. to 13 c . and from $4 \frac{1}{2} \mathrm{c}$. to 15 c . respectively, in the tables. Both were, on the yearly average, at their lowest in 1898, and at their highest in 1907. They are now over 40 per cent above the level of 1890-1899, and over 75 per cent higher than they were cleven years ago.

Canned salmon.-The price of canned salmon was 49 per cent above that of the base period in 1908, but dropped to 40 per cent above in 1909. Between 1898 and 1908 a rise of approximately 60 per cent took place.

A marked drop in price will be observed in the table of this product every fourth year. These declines occur in the years following the 'big run' of sockeye salmon and are to be attributed to this cause, prices advancing steadily during each of the three intervening years, when stocks became smaller. Prices are usually fixed for the year in the summer months, shipments beginning in August and the pack being as a rule well disposed of by the end of the year. It may be mentioned, in passing. that the inquiry into meat packing methods at Chicago, Ill., in 1907, had the effect of greatly enlarging the demand for canned salmon and of increasing prices.

A record of the packs of all grades of the various years since 1591 is as follows:"-

|  | Year. | No. of cases, 1 ll . tins Sockoye Talle. |
| :---: | :---: | :---: |
| 1491 |  | 314,893 |
| 1392 |  | 228,4\% |
| 1893 |  | 850,2m9 |
| 1894 |  | 494.871 |

| 1960 |  | 85\%,113 |
| 1901 |  | 1. $232 \mathrm{k}, 156$ |
| 1903 |  | 473,317 |
| 1904 |  | 4 23.894 |
| 1905 |  | 1.16i, 460 |
| 1906 |  | 629,460 |
| 1907 |  | 817.459 |
| 1908 |  | 812,689 |

[^8]Prices paid by the canners for fish vary from year to year. As compiled from the records published in the Labour Gazette they have been during the past nine years as follows:-

In 1901 the price per fish was $12 \frac{1}{2}$ cents during July and 10 cents during August.
In 1902 the following schedule was in force:-

Per fish. Cents.

Up to a pack of 200,000 cases. 20
From 200,000 to 250,000 cases. 18
250,000 to 350,000 $16 \frac{1}{2}$
 400,000 to 450,000 $13 \frac{1}{2}$ 450,000 to 500,000 ci . . . . . . . . . . . . . . . . .. .. .. .. . . . . . . $11 \frac{1}{2}$

In 1903 the price paid per fish was 15 cents in July and 14 cents in August.
The year 1904 was a very poor year and schedules were irregular.
In 1905 the price paid per fish was $12 \frac{1}{3}$ cents in July and 10 cents during the rest of the season.

In 1906 the price per fish was 25 cents in July and 20 cents in August; the same rates prevailed in 1907.

In 1908 the price paid per fish was 25 cents throughout the season.
In 1909 the price paid per fish was $12 \frac{1}{2}$ cents in July and 10 cents in August.

> V.-Other Foods.

Summary.-Under this heading are included fruits, fresh and dried; vegetables, fresh and tinned; flour, tea, sugar and general groceries. The complete list is as follows:-Beans, biscuits, chocolate, coffee (Rio and Santos), cream of tartar, flour (four varieties), apples, bananas, grapes, peaches, pears, plums, evaporated apples, currants, raisins, honey, maple sugar, molasses, oatmeal, black pepper, rice, salt, soda, sugar (granulated and yellow), tapioca, tea, potatoes, turnips, canned corn, canned peas, canned tomatoes, and vinegar.

The general price level of these commodities is at present below that of twenty jears ago. Prices were about 20 per cent above the average for the decade 1890-1899 in 1890 and 1891. From that period until 1897, however, there was a considerable decline; but from 1897, the movement was again upward, runtil a point twelve per: cent above the ten year average was reached ten years later. Since 1907 the general level has declined to a point seven per cent above the base average. Compared with 1897, prices in 1909 were 25 per cent higher.

Beans.-Beans which were as low as 50c. a bushel in 1897 sold for $\$ 2.60$ per bushel in 1909, a rise of over 300 per cent in the past 12 years. Prices were also high in 1890, 1900, 1903, 1905 and 1907, though the level in 1908 and 1909 has been higher than at any previous time within the twenty year period, being in 1909, 77.9 per cent above the average for the decade 1890-1899.

Biscuits.-Soda biscuits also reached their highest point in 1909, when prices were 21.7 per cent above the average for the decade $1890-1899$, and nearly 30 per cent above those of 1896 and 1900, the low years.

Chocolate.-Chocolate was downward in price from 1890 to 1893. From the latter date it remained steady until 1901, rising thereafter to a point 10 per cent above the level of the decade 1890-1899, and 14 per cent above the lowest year shown.

Coffee.-(Rio and Santos).-Coffee is shown at less than half the price in 1909 compared with 1890. Prices have been fairly steady for the past eight years, the chief decline having occurred between 1891 and 1899.

Cream of tartar.-This commodity also showed a considerable decline between 1890 and 1895, and though prices have ruled higher in the interval, they are shown on practically the same level in 1909 as in 1895.

Flour.-The lowest years shown for flour were 1894 and 1899, and the highest 1909. The increase in the past ten years has amounted to over 40 per cent. The rise, however, has been by no means continuous. The years 1904 and 1905 were characterized by high prices. These were followed by a recession in 1906, a recovery in 1907, and a pronounced upward movement in 1908.

Fruits, fresh.-Fresh fruits fluctuate rapidly owing chiefly to varying crop conditions. Apples reached their highest level in 1909. Bananas also were highest in that year. Peaches were higher in 1907 and grapes in 1900-1901, 1905 and 1906. Pears were highest in 1893 and plums in 1906.

Fruits, dried.-Evaporated apples were lower by over 35 per cent in 1900 than in 1890, but were 50 per cent higher than in 1897. Currants are 37 per cent higher than in the base decade, and over 75 per cent higher than in 1896, the low year. Raisins were at their highest point in 1890 and 1900, but are now 22 per cent below the average for the decade, though 15 per cent above the low year, 1895 .

Honey.-Honey was higher in 1909 than previously recorded in the tables, being 47 per cent above the average for the base decade, and nearly 80 per cent above the low year, 1897.

Maple sugar.-This article was highest in 1907. The 1909 prices are 8 per cent above the level of the base decade and over 30 per cent above that of the low year, 1898.

Molasses.-New Orleans molasses was very high in 1890-1891. It declined rapidly in 1892 and remained on a low level for several years. In 1900 it was 38 per cent below the average for the previous decade. In 1909 it was still 22 per cent below that average.

Oatmeal.-The high years for oatmeal were 1907, 1908 and 1909. In the last, the price was 43 per cent above that of the base decade and approximately 87 per cent above that of the low year, 1896.

Pepper.-Black pepper, which was very high in 1890, reached its lowest point in 1595-1896. A considerable adrance was recorded in 1900, and the high prices were maintained until 1909, when the level fell to one per cent above that of the decade 1890-1899 and approximately 33 per cent above that of the lowest jears.

Rice.-Rice in 1909 was 13 per cent above the level of the decade 1890-1599, and 19 per cent above the low years, 1894 to 1896.

Salt.-Salt prices are considerably below those of $1890-93$, though little change is shown since 1893. The sudden drop in 1892 is attributed to trade competition. In the last few years the tendency has been slightly upward. In fine salt the increase is attributed to the adrance in the price of cooperage stock, coal, and the small bags in which it is packed. Dairy and cheese salt have been stationary for several years, on levels lower than those prevailing in 1890-1895. As supplementary to the table of jobbers' prices for fine salt in bags quoted on a later page, the following statement, supplied by the courtesy of the Canadian Salt Company, Limited, of Windsor. Ont., will be of interest as showing the prices per barrel of three leading grades manufactured by that company since it began business in 1894:-

Soda.-Prices show a narrow range, being at their lowest in 1909, namely 20 per cent below the average for the base decade.

Sugar.-Both granulated and yellow sugars were much cheaper in 1909 than in 1890 and 1891, though prices since 1902 have changed less violently. Granulated sugar was lowest in 1903, and yellow sugar lowest in 1895. The range in actual prices was from $\$ 3.40$ per cwt. in April, 1895, to $\$ 7.25$ in 1890, in the case of granulated sugar, and from $\$ 2.625$ in April, 1895, to $\$ 6.375$ in January, 1890, in the case of yellow sugar.*

Tapioca.-The lowest price recorded was 3c. per lb, in 1903. This rose to 7 なc. per lb. in 1907 . Prices on the whole were high in 1890, since when there has been a decline of over 30 per cent. The highest level was reached in 190 , with prices 40 per cent above the average for the base decade.

Tea.-Japan tea prices were higher in 190S-1909 than in any previous year of the twenty year period. The advance in the latter year amounted to 32 per cent, compared with the base decade, and to 34 per cent, compared with the lowest years shown. The lowest actual price quoted for good common Japan tea was 16 c . per lb ., and the highest 25 c . per lb .

Potatoes.-Potatoes have been very high in price for six years past. The highest year was 1907 , and the lowest 1896 . In the latter year as low as 18 c. per bag was reconded, and in the former as high as $\$ 1.30$ per bag. Prices in 1909 were 42 per cent above the average of the base decade and over 160 per cent higher than those of the lowest year, 1896.

Turnips.-Turnips in 1901-1902 were approximately 70 per cent above the average for the base decade. The years 1903 and 1904 were also very high. In 1909, however, prices were on or about the same level as in 1890, being about 7 per cent below the average for the decade 1890-1899.

Canned vegetables.-Prices on the whole were lower in 1909 than in the base decade.

Vinegar.-There has been a considerable decline in the price of vinegar during recent years, attributed to an increase in the nummber of manufactories and resultant competiton. Prices in 1908-1909 were 30 per cent below the average for the base decade.

The duty on vinegar manufactured in bond, which was 3 c. per proof gallon in $18 \% 0$, was advanced to 4 c . in 1880 , and to 6 c . in 1894 . It was reduced to 4 c . per gallon in 1897 and has since remained unchanged.
VI.-Textiles.

Wool and woollens.-To obtain a series of quotations that would accurately reflect the course of prices of woollen fabrics in Canada was found a matter of considerable difficulty, owing largely to the absence of manufacturers' standards. Manufacturers of woollens vary their makes from season to season according to the dictates of fashion, the varying prices of the raw material, and the demand of jobbers for goods to be sold at a certain price. The cost of wool and the rates of wages are the factors which chiefly govern the price of the finished product. To reflect the former a series of quotations for Ontario washed and Ontario unwashed wool were obtained. As reflecting the finished product, quotations for a well. known Canadian yarn, a line of knitted underwear and a standard woven fabric were obtained from leading manufacturers. In quoting these articles care was taken to see that where any change in quality was introduced a corresponding change in price quotation was made by the manufacturers in order that the statistics might be on a uniform basis throughout.

The final results show that prices were highest in 1906 and 1907 and lowest in 1902, the advance in five year. amounting to approximately 50 per cent. Compared with the general level of the decade 1890-1899, wool prices in 1906 were 28.9 per cent,

[^9]and in 190723.3 per cent higher. There was a pronounced decline in 1908, and a considerable recovery in 1909, prices in the latter year being 14.2 per cent above those of the base decade.

As supplementary to the wool tables in Part I., the following charts prepared by Mr. E. B. Biggar, Proprietor and Editor of the Canadian Textile Journal, on the prices and production of Ontario wool will be of interest:-

## CHART OF PRICES AT ONTARIO WOOLEN MLLSS, 1571 TO 1908.

This chart shows the prices-indicated in cents by the figures at the sides-of certain wools from 1871 to 1908 . The heavy black line shows the price of Ontario combing wools, washed, in the Toronto market. The dotted line next above slows the price, in England, of English Lincoln wools of a class corresponding with Ontario combing wools. The line interrupted with single crosses, starting in 1890, gives Kentucky quarter-bred and three-eighths blood wools of a type at present nearest to Ontario wools, but these prices are for unwashed wools. The same wools, if washed, would show a range of prices about a third higher. The lines interrupted by double crosegs and ending at 1857 show United States wools of a type formerly comparing with Ontario combing wools, but in the washed condition. Information for a continuous record of wools of this class could not be obtained. The wary line shows the prices realized by Ontario wools after being sold in the United States markets, showing a difference of 10 to 15 cents per pound more than is obtained by the Ontario farmer in his own market. The quotations, wherever obtainable, were in the months of May and Junc. The remarkable slump in prices of all United States wools, during the Wilson regime, when wool was on the free list. will be noticed. Note also that in the period from 1871 to 1875 Canadian wools in the United States Market ranged in price from 55 c . to 90 c . a pound. while the prices in Ontario in that period ranged from 33e. to 52c.

As bearing more or less directly on the problem of wool production in Ontario, the following chart showing conditions in the live stock industry of Ontario is given:

CHART SHOWING NUMBER OF LIVE STOCK IN ONTARIO, 1841-1907.

From the above chart it will be seen that the number of head of horses in Ontario has increased from 201,000 in 1851 to 725,600 in 1907 , the number of cattle from 744,400 in 1851 to $2,926,000$ in 1907, and the number of swine from 850,200 to $2,049,600$ in the same period, while the number of sheep, after an advance till 1882 have delined on an average of years. Sheep raising advanced along with other live stock till about the time of the introduction of the factory system in the woolen industry, when growth fell off till a stimulus was given to exports by the free wool tariff of the United States. From 1895, when there were $2,022,700$ head of sheep in Ontario, the number decreased, till in 1907 it was less than in 1861.

Actual production of wool in Ontario from year to year since 1851 is shown in the following diagram:-

Wool Production in Ontario, 1851-1907.

It will be seen from this chart that wool production increased till approximately the general introduction of the modern factory system in the province. From the decade of 1871 it ceased to grow with population, and has since dechined to $4,500.000$ pounds, or $1,900,000$ pounds less than in 1871. If proluction had increased in the same ratio as population, the Ontario wool clip of 1907 would have been $9,600,000$ pounds at the average weight of fleece in 1871 ( $3 \frac{1}{2}$ pounds). But the average weight of fleece has increased from $3 \frac{2}{3}$ pounds in 1882 (in 1851 it was only 219 位 pounds) to 63 pounds in 1907 , at which rate the clip of 1907 would have been over $13,700,000$ pounds. It will also be seen that woolen manufactures developed along with wool production. till the advent of the factory system in the province.

Cotton and cotton goods.-Considerable difficulty was met in securing a series of quotations that might be regarded as reflecting fluctuations in the price of cotton good- in Canada during the past twenty years. Standards are frequently changed both in the weave and in the raw material used. Prices are particularly affected by three causes, namely, the price of raw cotton, the amount paid for labour, and competition from foreign countries. The last mentioned is felt particularly when trade is depressed in Great Britain and the United States, when representatives of the Einglish and American mills invade the Canadian market.

As on the whole best reflecting the price of the raw material, a quotation is given for raw cotton, upland, middling, in the New York market back to 1890 , the statistics being those employed for a similar purpose by the United States Department of Labour. The table shows cotton to have been on a very high level for the past six years, and especially in 1904 and 1909 , when prices were 65.9 per cent above the average for 1890-1899. Since 1898, the low year, raw cotton has more than doubled in price, having been as low as 5.875 c . per pound in 1597 and as high as 15.3 c . in 1909. The year 1890 was a high year, prices having passed 12 c . per pound in June and August.

In dealing with Canadian manufactured cottons a broad division was made between grey and bleached goods on the one hand, the manufacture of which is controlled by the Dominion Textile Company, Limited, and woven coloured fabrice or yarn dyed cotton goods, manufactured by the Canadian Coloured Coston Mills Company, Limited. By the courtesy of these companies, a record was obtained of the average value of their product back to 1890 . This was estimated on a pound basis, in which the mill accounts are kept, in view of the variations in styles above referred to.

Though the method of quoting finished product by the pound is not wholly satisfactory, inasmuch as the number of yards per pound varies from time to time owing to changes of standards and to variations in the proportionate production of fine and coarse goods, it is believed that in the present instance it enables a fairly accurate opinion to be formed as to price tendencies of Canadian manufactured cottons during the past two decades.

The average vearly price of 150 lines of Canadian cottons manufactured by the Dominion Textile Company, Limited, has increased from 18-19c. per pound during the years 1895 to 1899 , when prices were at their lowest, to $23-25 \mathrm{c}$. during the past four years, when prices have been higher than at any time since 1891.

The fluctuations of woven coloured cotton fabrics (ginghams, cottonades, shirtings, saxonys, \&c.), information concerning which was obtained by courtesy of the Montreal Coloured Cotton Mills Company, have been much the same as those of grey cottons. The low years were from 1895 to 1900 , with prices in the neighbourhood of $25-27 \mathrm{c}$. per pound. The high years were from 1905 to 1509 , when prices ranged from $33-36 \mathrm{c}$. per pound. The years 1890 and 1891 were also high years, prices being 32c. in the former and 1-2c. in the latter.

The record of prints by the yard shows the low years to have been from 1894 to 1897 , with prices from 6.71 to 6.7 Sc . There was a rise in $1898-1899$, and a pronounced rise in 1900, followed by a recession until 1907, when the highest price recorded, namely, $9.0 \pm$ c. was reached. In 1908 the price fell to 8.32 c ., but rose to $8: 54 \mathrm{c}$. last year.

The high price of raw cotton is held chiefly accountable for the higher prices of the past few years.

Silk:-Raw silk, Italian and Japan, was high in 1890, but declined to its lowest point in 1896. From the latter year until 1907 a gain of 50 per cent was shown. There was a rapid fall in 1908, with a slight recovery in 1909, prices being very close to the average for the base decade in the latter year. Silk threads have been stationary for eight years past, but are considerably lower than during the early portion of the twenty-year period. Compared with 1890, the highest year shown, the decline lias amounted to between 20 and 25 per cent.

Linen products.-Flax fibre was lower in 1899 than in any year since 1903, but was still seven points above the average for the decade 1890-1899. In 1895, the low year, prices were 25 per cent below that average. Prices in 1890 were the same as in 1909. Coarse and fine mixed tow, on the other hand, have fallen very rapidly since 1907, being now less than one-third the price of two years ago. From 1900 to 1907, prices were on a very high level, being double those of the base decade. Prices are at present on the same level as in 1891, 1892, 1893 and 1895, namely, 40 per cent below those of the standard decade. Flax sewing twire has risen 10 per cent in the past 12 years, having shown little or no change since 1905, and being, in 1901, on the highest level recorded in the tables.

Other textiles.-Jutes and hessians were very ligh in 1906 and 1907, but have since fallen to a point 12 per cent above the average for the decade, but nearly 25 per cent abore the level of prices in 1898, the low year. Prices of oilcloth are lower than in 1590 to 1893. Fluctuations since the latter year have been comparatively narrow, though the present prices are approximately 18 per cent above those of 1899 , the low year.

> VII.-Hides, Tallow, Leather, Boots and Shoes.

Prices in this group were on an average 35 per cent higher in 1909 than in the decade 1890-1890, being higher than in any other year of the twenty-year period. The low year was 1896 , since when the increase has amounted to 45 per cent.

Hides.-The most pronounced rise in the whole group was that which took place in 1909 in the price of No. 1 inspected steers' and cows' hides. The price, which had been as low as 3c. a pound in 1894, touched 14c. in 1909, and remained on or about that level for several months. No. 1 green calfskins showed an almost equal rise, the
price having stayed at 16 c . per pound for some months in 1909, this being the highest quotation shown in the table; in 1894 the price was 6c. through almost the whole year. Horsehides were higher in 1890 and 1891 than at present, but have been considerably lower in the interral, especially in the years 1894 and 1897.

Tallow.-Tallow reached its highest level in 1902, and its lowest in 1897. In 1909 it was about 12 per cent above the average for the base decade, a level approximately the same as that of 1907 and 1590 .

Leathers.-The years 1906 and 1907 were the highest for leathers, though prices in 1909 were only slightly below, being in the case of heary uppers, higher. The low years were from 1894 and 1890. Heavy uppers also showed the widest range in actual prices, namely, from 20c. per pound in July-October, 1896, to 48 c . per pound in October-December, 1909.

Boots and Shoes.-The three representative lines chosen for the purposes of the investigation were, a heavy working boot, pegged; a box calf blucher bal, Goodyear welted; and a woman's dongola bal, fair stitched. The two latter showed very much the same movement, namely, a steady increase amounting to between 20 and 25 per cent during the past 12 years. The first shows a much more rapid advance, the increase in 1907, 1908 and 1909 prices being approximately 50 per cent compared with prices during the decade 1890-1899.

## VIII.-Metals and Implements.

Under this heading, twenty-seven series of quotations are given, of which seventeen are of metals and ten are of implements. The metal quotations include seven series of iron, and one series each of antimony, brass, copper, lead, silver, solder, spelter, steel, tin and sheet zinc. Under implements are included anvils, axes, grindstones, hammers, horseshoes, mallets, picks, bench wood screws, soldering irons and vises.

Broadly speaking, metals were comparatively high in price in 1890 , but declined rapidly until 1897, when they were 15 per cent below the average of the decade 1890 1599. From this point there was a rapid recovery, followed by a decline in the year 1902, 1903 and 1904. In 1906 and 1907, however, a very high level was reached, chiefly owing to the high price of copper, antimony, tin and steel. There was a marked falling off in 1908 and a still further decline in 1909, in which year the general level was leso than two per cent above that of the base decade.

In the group of implements cited, prices have been much less variable; the recond from 1590 to 1909 shows an extreme variation of less than 14 per cent between the lowest and the highest points, which occurred respectively in 1897 and 1907 . In 1809 the general level was 2.4 per cent above the average for the decade 1890 -1899.

Among individual commodities, the following are the most striking fluctuations shown:-

Antimony.-The course of antimony has been extremely variable. In 1890 the price was 67 per cent above that of the decade; seven years later, prices were approximately 30 per cent below the same standard. After a slight rise and further fall, the price was almost trebled between 1904 and 1906. The high level wnt maintained umil 1907 , but the decline since has left the metal approximately 30 per cent below the standard of 1890-99.

Copper.-Copper has likewiso shown some notable variations, the low painta being in 1594 and 1595 , and the high points in 1899,1906 and $190 \%$. The present low price of copper is attributed in part to the competition of aluminium, which is now used extensively in electrical work where copper formerly had a virtual monopoly.

Iron.-Averaging the several quotations of iron, the high points were thown to be $19(0)$ and $190^{\circ}$, and the low points 1598 and 1904 . Iron in 1909 was lower then at any time since 1905.

Lead.-Lead, after declining considerably from 1590 to 1805 , roee rapidls to 1900 , after which most of the gain was lost, until in 1906 recovery $v a \operatorname{an}$ again made. The
highest point reached was in 1907, when the price was approximately 45 per cent above the normal. In 1909 it had fallen again to normal.

Silver.-Silver from 1890 to 1894 declined very rapidly. Since then, fluctuations have beeen of a minor character until the past two years, when a further decline occurred.

Tin.-Tin reached its lowest point in 1897, but nearly doubled in price within two years thereafter. The high level has been maintained since. ln 1907 the price was approximately double that of the base period. It has since fallen, but is still 50 per cent above the normal.

Zinc.-Zinc saw its lowest point in the twenty-year period in 1906, when the index number was S0.7. Two years later the index number was 134.7. In 1906 the number was $132 \cdot 0$, but this fell to 114 in 1908 and to 107.3 in 1909.

Implements.-Among the several implements quoted, the only one showing violent fluctuations was grindstones, which advanced rapidly in the two years following 1900. The adrance was maintained for four years, but about half of it has been lost since 1906. Speaking generally, the tendency in many lines of hardware, including workingmen's tools, has been downwarel during the past decade, owing to increasing competition between manufacturers.

## IX.-Fuel and Lighting.

Under fuel and lighting, coal and coke were selected as representing fuel, and coal oil and calcium carbide as representing lighting. To these, matches were added. Under the heading of coal it was sought to obtain prices representing the four chief sources of Canadian consumption, namely, Nova Scotia, Pennsylvania, the Rocky Mountain coal fields, and the coal fields of Vancouver Island. The quotations given for run of mines bituminous, on the wharf at Montreal are of Nova Scotia coal, and represent also the competitive price of Pennsylvania bituminous brought in by rail. The quotations of wholesale anthracite at Montreal may be taken as representing the standard of consumption throughout the portion of Canada dependent on this source for domestic fuel. Quotations of Crow's Nest Pass bituminous, from the opening of the mines up to the present, have been obtained, and quotations of Vancouver Island from 1903, the date when the Western Fuel Company began operations. The last mentioned quotations are not included in the calculation, the department desiring to obtain a record back to 1890 , though unable to do so up to the date of publication.

It will be seen that both Nova Scotia and British Columbia bituminous are considerably higher than during the decade $1890-1899$; anthracite is also higher. The high prices shown for the latter in 1902-03 are accounted for by the strike of coal miners in Pennsylvania which occurred at that period.

Connellsville coke, which is extensively consumed by manufacturing establishments in Ontario, and Crow's Nest Pass coke, which supplies the smelters of British Columbia, are quoted as representing coke prices. The Dominion Iron and Steel Company and other large concerns in Canada manufacture their own coke. The index number shows Connellsville coke to be 17 per cent higher than in the decade 1890 1899, but lower than in 1890, 1899, 1900, 1902, 1903, 1905, 1906 or 1907. The highest point shown is in 1903, but 1902, 1906 and 1907 were high years. The lowest year was 1894, when coke dropped 38 per cent below the average of the ten-year period. Crow's Nest Pass coke has been very steady, variations being within a range of 10 per cent. It is at present at approximately the same price as ten years ago.

Coal oil, both Canadian and American, shows a pronounced downward tendency during the past 12 years. Canadian oil which was selling for 20 cents a gallon in 1890 and higher in 1892-95, is now at $15 \frac{1}{2}$ cents. In American oil the drop has been greater, owing to the fact that American oil which twenty years ago sold at 5 cents a gallon higher is now to be bought at the same price as Canadian, and has also shared the decline of the latter product. The fact that the best American crude oil
mas be imported into Canada for refining purposes free of duty is held to account for the approximation in prices between the two products. The general decline is accounted for by the competition of other methods of lighting, and by improvements in the manufacturing and distributing processes. Numerous by-products previously little used (e.g. gasoline) are now in large demand. The tank wagon system of delivery has also cheapened the product.

The manufacture of calcium carbide was begun in Canada in 1894. The price held for five years at $\$ 76$ per ton, but dropped to $\$ 70$ in 1900-1901. ' Since that date it has sold at $\$ 65$.

Matches show an increase of 29 per cent in 1909 compared with the ten-year period. The increase is accounted for by the increase in raw materials and wages. As supplementary to the table published in Part I of the report, the E. B. Eddy Company of Hult, Que., has furnished the following statement with regard to the manufacturer's net selling price for Telegraph matches:-

the gradual increase being stated as 'due to the steady advance in wages for the past 9 or 10 years, and to the increased cost of all raw material entering into the manufacture of these wares.'

> X.-Building Materials.
(A) Lumber.

In dealing with lumber, the object has been to make the statistics as representative as possible of trade conditions in this important industry throughout Canada. As representative of the industry in the Maritime provinces, New Brunswick shingles and New Brunswick spruce are taken. Some difficulty was experienced in selecting grades that would actually represent the great lumbering industry of Ontario and Quebec. In the case of pine, a high grade product, a medium grado product and a low grade product at Ottawa are chosen. A high grade pine product at Toronto, as representing the output of the Georgian Bay mills, is added. Of recent years, with the increase in the price of pine, hemlock as a cheaper substitute has come into extensive use, and is added for that reason, though it reflects closely the tendency of lower grade pines. Perhaps the best criterion of lumber tendencies in this connection are the figures which were obtained from certain large manufacturing concerns of the Ottawa valley, showing the average price at which their entire cuts were disposed of from year to year back to 1890. Though the quality of the logs may have raried in different years, thereby entailing variations in the apportionment of grades, the figures in question are based on the outputs of several mills, with the result that this tendency is probably obliterated. The figures show a rise from $\$ 12$ per thousand feet in 1890-2 to $\$ 21.50$ per thousand in 1907, the high year. In the case of hardwoods, birch, soft maple and red oak at Toronto have been quoted.*

The tread of prices of British Columbia lumber prices duriag the past twentyfive years is indicated in the following table which shows the average pricen at which lumber cut on Dominion lands in the railway belt was sold.

it will be seen that after a period of stationary prices ( 1590 to 1895), lumber prices declined somewhat in 1896, 1897 and 1898. Since the latter date, however,

[^10]there has been a very pronounced upward movement, which reached its culmination in 1907. Subsequently, there was a falling off until the closing months of 1909, when some recovery was made. The increase in the case of pine amounted to fully 70 per cent. The higher grades have been steadier, but the lower grades have mounted very rapidly. The highest rise is shown in the case of pine laths, which more than quadrupled in price between 1897 and 1907, and were in 1909 over 130 per cent above the avernge of $1890-189$ ?. New Brunswick lumber advanced 50 to 60 per cent in the decade 1595-1909. In the hardwoods, the rise, as compared with the ten-year period, has been between 25 and 30 per cent, except in the case of oak, which advanced over 80 per cent.

In explaining these pronounced advances in a product so important as lumber, the manufacturers point to several agencies which have combined to enhance operating expenses. Supplies for the camps have advanced. Wages also have been increased, while the supply of experienced help has greatly declined, so that at the higher rate a less efficient staff of employees is available. The timber, moreover, is not so good as formerly, the logs being smaller, entailing a greater loss in driving, and a less return from a like amount of handling. The merchantable timber is found at inereasing distances from the main streams. Added to this there has been a marked advance in stumpage rates; limits that sold at $\$ 3-\$ 4$ per thousand in 1890 are bringing $\$ \delta-\$ 10$ per thousand at the present time.

## (B) Miscellaneous building materials.

The list includes bricks, cement, lime, plaster, \&c., and some representative articles of builders' hardware. On the whole, prices are shown to be higher than during the standard decade by 5.7 per cent.

Bricks.-Common building bricks were 46 per cent higher in 1909 than in the decade 1890-1899. Since 1898, the low year, they have risen over 70 per cent. Fire bricks, on the other hand, have gone down, as compared with the decade, by 8.5 per cent, but are higher than in 1896.

Cement.-Canadian Portland cement was lower in 1909 than in any previous year quoted, being 37 per cent below the decade 1890-1899. The highest year shown was 1890, but there was an upward movement in 1899-1900.

Lime.-Lime had advanced steadily during the past ten years, being 27.6 per cent above the average for the base decade in 1909, and approximately 50 per cent higher than in 1898. Prices between 1890 and 1898 declined about 20 per cent.

Nails.-Cut nails were lower in 1909 than in 1907. The highest year shown was 1900 (126.3), and the lowest, 1897 (81.2). Wire nails, which are now in such extensive use, did not appear in the trade journal quotations prior to 1897. They are somewhat higher at present than in that year, and are 20 per cent higher than in 1898, the low year. As in the case of cut nails, the high year was 1900 , since when the decline has amounted to fully $33 \frac{1}{3}$ per cent.

Pitch and tar.-Crude coal tar is lower than during the decade $1890-1899$ by 12.5 per cent. Pitch (Sydney roofing) has also declined considerably during the past eight years, but is higher than during the decade 1890-1899.

Hinges, \&ec.-The quotations for heavy hinges show a pronounced rise since 1897, amounting to approximately 45 per cent. Sash weights are over 50 per cent higher than ten years ago, but have been higher still in the interval. Soil pipe has shown little change for some six or eight years past, but is higher by over 30 per cent than in in 1896 , though lower than in 1890.

Wire fencing.-Wire fencing declined very rapidly from 1890 to 1898 , the price in the latter year being only about one-third of the former. Subsequently there has been a recovery of about 40 per cent, but prices are still 30 per cent lower than during the base decade. In the case of wire cloth, the course of prices was somewhat similar, though fluctuations were less violent. Prices are now approximately 35 per cent below those of the base decade.
(c)-pants, oils and glass.

Fourteen articles are included under this heading. Averaging the whole, prices in 1909 were over 35 per cent higher than during 1890-1899. There was a decline of six points since 1907. The lowest year was 1897 , since when the gain has been orer 40 per cent. Between 1890 and 1897 a gradual fall, amounting altogether to 14 points, occurred.

Benzine.-Prices have ranged from 12c. to 15 c . per gallon within the 20 -year period. In 1909, they were 25 per cent above the base average. The highest year shown, however, was 1903 , when prices were 87.9 per cent above those of the base decade. The low year was 1898.

Glue.-Prices showed only minor fluctuations. They were lowest in 1897, since when they have recovered to a point little removed from the average of the base decade.

Linseed oil.-Linseed oil, raw and boiled, declined from 1590 to 1897, but rose thereafter rapidly until 1901. There was a decline in 1904 and 1905, followed by a recovery. Prices are now approximately 10 per cent above the average of the decade 1890-1899.

Paris green.-The highest year shown was 1907 with prices 76 per cent above the average for the base decade. Prices are now 15 per cent above that average, a gain of 27 per cent compared with the low year of 1593.

Prepared paints.-Quotations for a standard grade of pure prepared paints show prices higher in 1908 and 1909 than at any previous time in the twenty years. Compared with 1897 , the gain amounts to approximately 30 per cent.

Putty.-Putty is somewhat lower than in 1902-1903, but is on about the same level as in 1896-1897. The lowest year was 1905, since when there has been a gain of nearly 14 per cent.

Rosin. -In rosin, prices were low from 1890 to 1896 . They rose abruptly 37 per cent in 1897, and continued on or about the same level until 1903 when a further pronounced rise amounting to at least 40 per cent took place. Since then there have been still further and very material increases each year until 1908-1909. Pricris are now approximately four times those of twenty years ago.

Shellac.-Shellac reached its highest level in 1904-1905, when it was about 81040 per cent above the average for the decade 1590-1899. In 1909, it had declined to 13 points below that average, being lower than at any previous time shown.

Turpentine.-Turpentine was somewhat high in 1890 and 1891, but had fallen by 333 per cent in 1596 . There was a steady and very rapid rise from the latter year until 1900. After a decline in 1901 the rise continued until 1906, when prices were 82.5 per cent above the normal. There was a recession in 1907, and a further recession in 1908, followed by a slight gain in 1909, when the average was 22 per, cent above the decade 1890-1890, and approximately 50 per cent above the prices of 1895 1596.

Varnish.-Varnish has been on a high level since 1701, the highest point being reached in 1902. In $190 S$ and 1909 , prices were approximately 35 per cent above those of the base decade. The low year was 1899 since when tho rise has amounted to approximately 50 per cent.

Venetian red, dry colour.-Fluctuations have been within a narrow range for the past twenty years.

White lead.-From the low year 1896 , until the high year $190 \%$, the gain has been approximately 55 per cent. Since 1907, however, prices have ree rded, though in 1909 they were still 17.5 per cent above the normal of the decade $16 \Omega 0-1699$.

Window glass.-The 1909 prices were over 90 per cent higher than those of 1605 . the low year. Prices were high in 1590, hut declined rapidly during the mening five years.

## NI.-House Furnishings.

Furniture.-Quotations were obtained for six representative lines, namely, kitchen tables and chairs, dining room tables and sideboards, bedroom suites, and iron bedsteads. In all lines of wooden furniture a steady and pronounced rise in prices during the past twenty years is shown. On an average the increase since 1890 has amounted to approximately 50 per cent. The increase in wages and in the prices of hardwoods is held accountable by manufacturers for this advance, notwithstanding that there has been a marked improvement in machinery during the past twenty years, which has enabled a finer finish to be placed on goods and more elaborate designs to be turned out with the same or less expenditure.

In iron and brass bedsteads, on the other hand, there has been a pronounced decline. The line quoted is a continuous pillar bed of shipping weight, about seventyfive pounds. It shows a decline from $\$ 6.51$ in 1890 to $\$ 3.50$ in 1909. The explanation offered by a leading manufacturer is that the manufacture of this article in Canada has reduced the cost both of brass and iron bedsteads.

Grockery and glassuare, table cutlery and silver plated ware.-The general tendency in these lines has been downward, especially during the first half of the tenyear period. The goods are manufactured chiefly outside of Canada, especially in Great Britain, and the reduction in price is attributed largely to trade competition. The rapid decline in silver-plated ware in 1907 followed the opening of a large establishment for the manufacture of this class of goods in Canada. Improvements in the manufacturing process have bettered the appearance of the goods.

Kitchen furnishings.-Pails, tubs and brooms are included under this heading. The various articles of tinware, hardware, \&c., are not standarized to any extent in Canada and it was found impossible to obtain a satisfactory record back to 1890 , outside of the raw materials represented therein. There has been an advance of from 12 to 15 per cent in pails and tubs compared with 1890 , and of approximately 30 per cent compared with the low years, 1896-1897. The most extraordinary advance, however, is shown under the heading of brooms, which in the closing days of 1909 had considerably more than doubled, as compared with the prices ruling in 1890. This, however, was largely accounted for by a scarcity of broom corn last year following a failure of the yield in the United States, the cost of broom corn to the manufacturer having advanced from $\$ 8-\$ 10$ to $\$ 20-\$ 24$ per ton. Apart from this advance the price of brooms has been fairly stationary for the past ten years.

> XII.-Drugs anel Chemicals.

Prices were on the whole higher in 1890 than at any time since. The lowest point was reached in 1899. There was a rapid recovery in 1900, after which prices remained steady. They then rose to within a short distance of the point reached in 1890, remaining on or about the level until 1907, there being a recession in 1909. In the last year prices were approximately 4 per cent above the level of the decade 1890 1899, compared with 6.7 per cent below that average in 1899, and 10.5 per cent above it in 1890.

Alcohol,-65 over proof.-Prices were considerably higher in 1909 than in any previous year in the last twenty years. The rise from 1890 has been steady, though prices remained unchanged from 1898 to 1907 . At present, prices are 25 per cent above the level of the decade 1890-1899 and fully 45 per cent higher than in 1890.

Methylated spirits.-The price of methylated spirits remained steady for several years but recently declined very materially. It is now at least 50 per cent below the previous standard.

Since the year 1888, all methylated spirits has been supplied by the Department of Inland Revenue, Canada, the privilege of manufacturing in bond having been withdrawn in that year. The price since charged by the department to manufacturers in the mechanical arts is shown in the following table:-

1 Consigned to points east of Toronto and west of Quebec.
${ }^{2}$ Consigned to points beyond Toronto and Quebec.
Alum.-Prices are on approximately the same level as in 1590, but were higher from 1891 to 1897 and lower from 1898 to 1908.

Bleaching powder.-Prices were high from 1892 to 1896 and again from 1900 to 1902. The jear 1900 shows the highest level. They are now about 4 per cent below the average for the base decade.

Borax declined very rapidly from $1890-1891$ to $1898-1899$. Since then there has been a partial recovery, though prices are still 35 per cent below those of the base decade.

Brimstone.-The highest year shown was 1892 , following which there was a decrease of 18 per cent followed by a recovery to a level slightly above the average for 1890-1899.

Carbolic acid.-This commodity was very high in 1890 , but fell fully 70 per cent in the two following years. The lowest year was 1899, prices being then 20 per cent below the base decade. Prices again became very high in 1592, 1893 and 1594, in the last year standing at 78.5 per cent above the level of the base decade. There has heen a recession since, especially in 1909, but prices are still 53 per cent higher than in the decade 1890-1899.

Caustic soda.-Prices for this article were downward from 1891 in 180\%, following which there was a gradual rise to 1904 , with a recassion in $190 \%$, to a point 5 per cent above the level for the base decade, a level which has been mainaained since.

Copperas.-Prices advanced 60 per cent between 1890 and 1891, but fell to an almost equal extent in the following year and still further in 1893, 1897 and 1895. Prices are now the same as ten years ago, being approximately, 15 per cent below the level of the decade 1890-1899.

Glycerine.-Prices in 1909 were on approximately the samo level as during the base decade. They were highest in 1896 and 1890 , and lowest in 1905, 19013 and $180 \%$,

Muriatic acid.-This commodity was steady for the first seven years of the period. A pronounced rise occurred in 1895 and further increases in 1902 and 1903. In the latter year prices were 76 per cent above the normal. They doclined in 100 s and advanced in 1909, but are still 17.6 higher than those of the base decarle.

Opium.-Prices were at their highest in 1909, namely, 41.2 per cent above those of the base decade. From 1890 to 1908 the varistions were within comparntivoly narrow limits.

Quinine--Quinine prices have been downward especially during the past two years. The highest year wa $=1590$, when prices were nearly double what they are at present.

Soda ash.-From the low year 1900 until the present there has been a gain of over 40 per cent, though prices were on a higher level in 1891-1892.

Sulphuric acid. This important article has been steady for five years past, on a level nearly 40 per cent higher than that of the base period. The low years were from 1598 to 1903 , when prices were 7 per cent below those of the base decade.

## XIII.-Miscellaneous.

Under this heading are included furs, liquors and tobacco, and sundry materials, namely, binder twine, rope, rubber, soap and starch.

Furs.-Four kinds of skins are grouped under this heading, namely, mink, muskrat, racoon and skunk. The price record shows an exceedingly rapid upward movement during the past few years. In 1805, prices were 20 per cent below the arerage for the decade 1890-1899. Three years later they were 11 per cent above, and in 1900 they had reached a point 47.3 per cent above. A further upward movement occurred in 1903 and 1904, and by 1905 the index number showed a gain of 117 per cent. The highest point reached was in 1907 when prices showed a gain of nearly 140 per cent. There has been only a slight recession since.

Liquors and tobacco.-Liquor and tobacco prices were steadily upward from $1 s 90$ to 1907 , the gain amounting to approximately $33 \frac{1}{3}$ per ceat. There was a recession in 1908, but prices have been firm since. Malt was lowest in 1896 and 1899, the gain from the latter year to 1907 being 55 per cent; there was a marked decline, however, in 1908. Whisky has varied only at considerable intervals. The same statement is true of ales, porters and tobacco.

The price of liquors and tobaceo is determined in part by the excise duties levied by the government. The following record of changes in the duty will assist in the explanation of the abore price changes.

## Spirits.

1850. Duty increased to $\$ 1.00$ per imperial gallon, proof, if made from raw or unmalted grain.
Duty increased to $\$ 1.02$ per imperial gallon, pronf, if made from malted barles on which no duty has been paid.
Duty increased to $\$ 1 \cdot(3$ per imperial gallon. rroof, if made from molasses or other saccharine matter on which no duty of customs has been paid.

Meno.-The test for duty at closed spirit receiver, was changed from gauge to weight, July 1, 1891. The gallon was determined by weight, for warehousing and ex-warehousing of spirits, January 1, 1875.
1867. Duty 1c. per 1 lb .

18\%\%. " increased to 2c. per lb .
1879. " reduced to 1c. per 1 lb .
1891. " raised again to 2c. per lb.
1594. " reduced to $1 \frac{1}{\mathrm{c}} \mathrm{c}$. per lb., at which it remains at present. Malt Liquor.
1867. Puty was 3 lac. per wine gallon.
1877. " increased to 8c. per imp. gallon.
1883. "" reduced to 4 c . per imp. gallon.

1891: " raised to 10c. per imp. gall., on which is the present tariff.

Tobaco. (Made from Foreign Lelf.)
1867. Duty was 10 c . per 1 lb .

15\%0. " increased to 15 c .
15\%. " increased to 20c.
1853. "f reduced to 12 c ., except when put up in packages of less than $1 / 20 \mathrm{lb}$., wheu duty remained at 20 c .
1885. " increased to 20 c . per 1 b ., and 35 c . per lb . when put in packages less than 1/30 lb.
1591. " made 25 c . per lb., irrespective of size of packagec, at which rate dutr now remains.
190s. "Rearrangement in the manner of collecting, duty being reduced to 50 . per lb. and bulk of tax collected on foreign raw leaf, resulting in no increase in the aggregate.
Binder tuine.-Binder twine was lower in 1899 than at any time since. In 1590, prices were nearly 35 per cent above the base decade. In the low year, 1095 , however, they were nearly 30 per cent blow that standard. Prices were highest of all in 1902, but the decline has since been continuous. They are at present on approximately the same level as the average for the decade 1890-1899.

Gunpowder.-The price of standard sporting gunpowder has remained unchanged during the twenty-year period.

Rope, sisal.-Prices are now on approximately the same level as during the decade 1890-1899, but there has been a heavy decline since 1907. The variations as a whole are the same as in the case of binder twine above.

Rubben-Rubber during 1909 was 85 per cent higher than during the decade 1590-1599. Compared with the low year, 1894, the gain has amounted to nearly 120 per cent. It may be addel that prices since the beginning of 1910 have shown further advances.

Soap.-Soap is approximately 10 per cent higher than during the base decade. but there has been a rapid decline since 1907 and 1903.

Starch.-Prices are at present 34 per cent higher than those of the base decade being somewhat lower than in the high year 1908. The low year was 1892, compared with which a gain of 50 per cent is shown.

## Other Groupings.

The groupings into which the commodities have been arranged were dictated largely by Canadian industrial and commercial conditions. Other arrangements of the comnodities may be desirable with specific ends in view.

For example, the following tables show the general level of prices in 1909, eompared with those of the decade 1890-1899 for the following groups:-1. Crude farm products; 2. Manufactured farm products; 3. Imported foods; 4. All foodstuff: nul.
5. Products of the mine.

Crude Farm Produce.

## Crude Farm Produce-Continued.

Wool, unwashed. ..... 107.5

To the above it may be added that the 110 articles manufactured in Canada contained in the list of commodities quoted in the present investigation show an average level of 114.1 per cent in 1909, compared with the average for the decade 1590 1599.

From the above and other analyses several important central facts as to the general situation at present may be ascertained. Of the great producing industries, agriculture seems to show the largest increase in prices. Crude farm products (grains, fodder, meat producing animals, milk, eggs, wool, fruits, vegetables) have advanced by over 37 per cent compared with the base decade. The products inade therefrom (meats, bran, flour, hides, leather, \&c.) have increased by over 34 per cent. On the other hand imported foods are lower than they were during the decade 1590 . 1899. Fish products are nearly but not quite so high as farm products. Products of the mine are only slightly above the level of the decade, and, if coal be excluded, are below that average. Coming to Canadian manufactured products, the general level is about 14 per cent above the level of the basc decade. Included in this estimate are various grades of Canadian lumber which on an average are 50 per cent dearer than during the base period. If lumber be excluded, the manufactured products of Canada show a gain of less than 10 per cent compared with the decade 1590-1899. These and other facts of a like nature are of the utmost significance in connection with the interpretation of the results of an investigation like the present. The tablos of index numbers will permit of many variations upon the theme.

## Comparative Prices, 1890-1899, in Canada, Great Britain and the United States.

Part II. of the appendix to this report contains, as above stated, a review, in greater or less detail, of the findings of the best known index numbers of Great Pritain, the United States and other countries. These are reprinted in order to render easily available a body of material of exceptional value in connection with the study of prices, and as throwing light (prices of many articles being determined by world conditions) on the current situation in Canada. The reader is referred to this matter for detailed information as to recent price movements in other countries. It will te of interest here, however, to base on certain of the tables and diagrams therein reproduced, a comparison of the course of prices in Canada, as shown by the present investigation, with the current movement in Great Britain and the United States, the two countries with which the commercial and ceonomic interests of the Dominion are most closely associated.

In the United States the Department of Labour conducted in 1901 an investigation into the course of wholesale prices dating from 1890. The inveatigation has been continued from year to year since. It covers 261 commodities, many of which are the same as those covered in the present inquiry. In Grent Britain one of the most widely quoted index numbers is that of Mr. Sauerbeck, which in representative of forty-five commodities and forms a contimous recond from the ycar 1818 to the present time. Using these as a basis the aconupanying chart han been constructed as a means of showing the comparative trend of general prices in the three countrics during the twenty-year period.

The United States Department of Labour's index number is constructed with the decade 1890-1899 as standard period. It may be compared, therefore, directly with the number of the present inquiry. Mr. Sauerbeck's number is based on the period 1567-1877. It is accordingly necessary, for purposes of direct comparison with the Canadian and United States numbers, to recalculate it with the same period as standard. As Mr. Sauerbeck's number for the decade 1890-1899 is 66, an approximate recalculation of the number with the period 1890-1899 as base may be effected by making the number for the period equal to 100 and calculating the other yearly numbers accordingly.

Referring to the chart, it will be observed that the general course of prices has been similar to the three countries, but that the movement as between Canada and the United States has been on lines more nearly parallel from year to year than as between Canada and Great Britain.*

## Concluding Remarks.

For a reference to the causes of the present upward movement of prices and to the effects upon individuals or classes in the community, with which a summary of this nature might be expected to conclude, the reader is referred to Part III. of the appendix, which may be read in this place.

Opportunity should be taken here to express the thanks of the department to a large number of persons and firms, who, at considerable trouble to themselves, furnished prices, records and other information, or verified the statistics collected elsewhere. Without co-operation of this nature, which was freely furnished in almost every case in which it was requested, the extent and accuracy of the report would have been very materially curtailed.

As already stated, it is hoped to continue the present record into the future and to enlarge and otherwise improve it as the time necessary is available. Any assistance which can be afforded in this connection by persons or institutions having information with regard to prices will be very gladly received.

\section*{VIII.-METALS AND IMPLEMENTS.}
60. Metals and implements (all).
61. Metals (all), and implements (all).
62. Antimony and copper.
63. Iron and steel.
64. Iron: pig-iron, Canada plates, and tin plates, coke Bessemer.
65. Iron: tin plates, (charcoal) and boiler plates.
66. Iron: common bar, black sheets, and galvanized iron.
67. Solder, lead, and silver.
68. Tin, spelter, and zinc sheets.
69. Anvils and axes.
70. Horseshoes and mallets.
71. Grindstones and sledge hammers.
72. Soldering irons and vises.
\(=\) Iron, Common Bar; Iron, Black Sheets; Iron, Galvanized Sheets; Iron, Tinplates; Iron, Boilerplates; Lead; Silver; Solder; Spelter; Steel Billets; Tin; Zinc, Sheets; Anvils; Axes; Grindstones; Hammers, Sledge; Horseshoes; Mallets; Picks; Wood Screws; Soldering Irons; and Vises.

Wholesale Praces, 1890-1909; Chart No. 114. CHART SHOWING RELATIVE PRICES OF SOAP, STARCH, AND RUBBER, 1890-1909.
(Average Price \(1890-1909=100\) )

\section*{APPENDIX.}

\section*{MEMORANDUM ON THE CONSTRUCTION OF AN INDEX NUMBER OF COMMODITY PRICES, WITH A REVIEW OF IMPORTANT BRITISH AND FOREIGN INDEX NUMBERS, AND \\ a statement relating to the causes \\ and effects of variations in \\ PRICES.}

\section*{I.-THE CONSTRUCTION OF AN INDEX NUMBER OF COMMODITY PRICES FOR CANADA.*}

To measure fluctuations in the price of a single commodity over a given period of time involves only the inspection of a series of accurate quotations of the commodity covering the period in question. But when it is desired to ascertain the general effect of the price-movements of two or more commodities, or even to compare the relative significance of changes in the price level of each, a new and different problem arises. It becomes necessary to contrive a method whereby facts so apparently remote from each other, if not incompatible, as, say, a rise in the price of milk measured by the quart, and a decline in the price of pig iron measured by the ton, may, in effect, be stated in the terms of a common denominator, and reduced to a single expression.
- Bibliographical note.-In 1886, the British Association for the Advancement of Science appointed a committee consisting of Mr. S. Bourne, Professor F. Y. Fdgeworth, Professor H. S. Foxwell, Sir Robert Giffen, Professor Alfred Marshall, Mr. J. B. Martin, Professor J. S. Nicholson, Mr. R. H. Inglis Palgrave, and Professor Sidgewick, for the purpose of investigating the methods of ascertaining and of measuring variations in the value of the monetary standard.' The reports of this Committee, published in 1887, 1888, 1889 and 1890 , especially the memoranda of Professor Edgeworth attached to the 1887 and 1888 reports, constitute the most exhaustive treatment extant of the subject of index numbers. An abridgment of these reports may be found in the article 'Index Numbers' in Palgrave's Dictionary of Political Economy.' The principles and limitations of index numbers are discussed in the Report of the Royal Commission on Gold and Silver, Great Britain, 1887-1888. Seo especially the evidence of Sir Robert Giffen and Professor Nicholson before the Commission. The celebrated essays of Jevons, which, notwithstanding the earlier experiments of Newmarch, may be said to have established the index number as a scientific method, namely, 'A Serious fall in the Value of Gold Ascertained and its Social Effects Set Forth' (1863); 'Variations of Prices and the Value of the Currency since 1782' (1865); and 'The Deterioration of Gold,' (1869) have been re-published in the volume, 'Investigations in Currency and Finance,' issued in 1884. Giffin's 'Essays in Finance,' 1880-1886, especially the second series, are classic. Sidgwick's Principles of Political Economy, Book I., chapter 2, on 'the definition and measure of value,' contains a succinct view of the general problem. Nicholson's 'Principles, Book 3, is similarly to be commended among rocent works, especially for its concise discussion of the 'quantity theory' of money. See also in the latter connection the same author's 'Money and Monetary Problems,' 1895, Jevons' 'Money and the Mechanism of Exchange,' F. A. Walker's 'Money' and Laughlin's 'Principles of Money.' Bowley's - Elements of Statistics' devotes a chapter to index numbers.

Matter appertaining to the more important index numbers, with which material of a general character is combined, will be found as follows: With regard to the Economist's number, see the 'Annual Commercial History and Review' of that Journal, first published in 1864; publication of the index number was begun in the issue for 1869. Saurbeck's index number was first published in the Journal of the Royal Statistical Society for September, 1886 (q.v., page 581 ;- see also the article published in the issue for June, 1893, page 215). Palgrave's number is contained in an appendix to the Third Report of the Royal Commission appointed to inquire into the Depression in Trade and Industry, 1886 (see page se8 et seq.) The index number of the United States Senate Committee on Prices (1891), was published in a report issued in 1893, which includes an extensive introduction and a discussion of various index numbers by Professor Falkner. Soetbeer's 'Materialien' (very authoritative) has been translated into English as an appendix to the Report of the Royal Commission on Gold and Silver, 1887-1858, and in the United States consular reports for 1887. A report of the British Board of Trade on wholesale and retail prices, published in 1902, contains a valuable memorandum by Mr. Fountain on the construction of index numbers of prices. The Journal of the Royal Statistical Society, the British Economic Journal, the Yale Review, the Ouarterly Journal of Economics, have articles by Professors Pierson. Edgeworth. Taussig, Flux, and others on the theory and practice of index numbers. Mayo Smith's 'Statistics and Fconomics' contains an illuminating chapter on the statistical treatment of prices.

For further references, see the list of authorities appended to the article on Index Numbers' in Palgrave's Dictionary of Political Economy, and in the report of the British Board of Trade, 1902, on Wholesale and Retail Prices, p. 417. Still more extended bibliographies are contained in Laughlin's 'Principles of Money' (p. 221) and Walsh's 'Measurement of General Exchange Value' (1901). Laughlin describes the latter work as 'quite the most thorough and systematic discussion of the whole problem yet made:

The present memorandum is based on the above, and is designed to describe briefly the more important technical problems involved in the construction of an index number and how those have been met in the present report.

The method usually adopted to accomplish this is the employment of index numbers. An index number is the ratio between the price of a given article or number of articles at a given date and the price of the same article or number of articles at some other date or period selected as a base or standard. Percentages being purely relative expressions may, when reckoned on a common basis, be combined or compared in a way impossible with actual prices.

For example: Mr. Sauerbeck's index number for English wheat for the year 1855 is 137, and for the year 1885, 60. The base period used by Mr. Sauerbeck is the eleven years 1867-1877. The meaning of these index numbers is, therefore, that in 1855 English wheat was 37 per cent above the average price which prevailed during 1867-1877, and that in 1885 it was 40 per cent below that average price. The actual prices of English wheat per quarter quoted by Mr. Sauerbeck in this connection are:-

Though the term index number is occasionally employed, as above by Mr. Sauerbeck, to denote the relative price of a single article, it more frequently implies a combination of such percentages, whereby a general judgement may be obtained as to whether on the whole prices have risen or fallen. It was, in point of fact, as above stated, because of its potentialities for combination, that the index number as an expression of prices was first devised.

Thus, Mr. Sauerbeck's index number for flour in 1885 is 63 . By taking an average of this number with the number given above for English wheat in the same year it is possible to say (assuming both commodities to be of equal importance) that the index number of wheat and flour in 1885 is \(61: 5\). It may be added that the London Economist, whose index number is one of the most widely quoted, simply adds together the percentages of the various commodities and regards the sum as the index number. The usual method, however, is to reduce this sum to the form of an average by simple division.

As an example of the manner in which index numbers of commodities may be combined in groups having something in common, as well as on general lines, Mr. Sauerbeck's latest annual suminary may be quoted§:-

Sauerbeck's Index Number, 1908, by Groups of Commodities.
(Average prices \(1867-1877=100\) ).

\footnotetext{
§ Journal of the Royal Statistical Society March, 1908, p. 74.
}

This table simply means that the amount of money for which certain quantities of forty-five different commodities could be bought in England in 1908 bore to the amount which would have been required to purchase them at the average prices of 1867-1877, the ratio of 73 to 100.

Continued from year to year, such a calculation enables one to read at a glance the extent of the upward or downward tendency of prices, both for certain groups of commodities and for the list as a whole.

\section*{Uses of Index Numbers.}

The uses to which index numbers, representing a proper selection of commodities and constituting a scientific apparatus for determining changes in price levels, may be put, are varied. Briefly they may be stated under two main headings:
1. The praatical use.-Variations in prices affect all classes and individuals in the community. Their effect upon producer, dealer and consumer is immediate, and the ability to measure a general rise or fall in prices is for a variety of reasons of first importance in the economic and social world.

To take an obvious instance: That earnings and prices should move simultaneously and on parallel lines is essential, not only to stability of relations as between capital and labour, but to general economic well-being. If wages do not follow a rise in prices, suffering may be involved for the labourer through the enhanced cost of living; on the other hand, if prices fall and wages remain unchanged, the cost of production on account of wages may become disproportionate and the crippling of indudiry may result. Socially, a failure to adjust earnings to prices may have farreaching results; as when a fall in grain prices leads to the abandonment of farms. or a rise in bread prices breeds political revolution. Alison attributes the fall of the Roman Empire to low prices. From this cost of living standpoint, retail prices form the most effective basis for estimating changes, as being subject to variations on account of local or special conditions and as representing in any event the actual cost of commodities to the consumer.

Again, on general trade and speculation, and, to go back a step further, on the process of production, the effect of rising or falling prices is immediate. A barometer of price changes, especially of certain articles like iron and coal, furnishes an excellent indication of current trade and industrial activity, and means, therefore. of judging future conditions. For this purpose wholesale price statistics, as being the more sensitive to general trade conditions, are preferable to retail.

The whole question of the practical value of index numbers has been dealt with by Sir Robert Giffen, in the now classic series of reports of the committee appointed by the British Association in 1886, 'for the purpose of investigating the best method of ascertaining and measuring rariations in the value of the monetary standard,' in the following terms*:-

The main practical uses for which the measurement of variations in a monetary standard has been desired appear to be the following:-
1. The fixation of rents or other deferred payments extending orer long periods of time. for which it has been desired to obtain a currency of a more stable sort than money is supposed to be. This has been a practical question of great importance from the days of Fleetwood's 'Chronicon Preciosum which begins, as is well known, with a remarkable case of conscience-whether a man in order to receive a bursary or scolarship, for which a declaration that his private income does not exceed, say, fire pounds a year, is required, is justified, the value of money having fallen proportionately, in making the declaration upon an income not exceeding thirts pounds a year. In recent times there is at least one instance of a different standard from metal being deliberately substituted on a large scate, viz., the tithes averages, these being made to vary with the value of grain, so that in effect the tithe is so much grain, and not so much money. The Sootch Fiars prices have existed for more than two centuries for similar purposes.
2. To enable comparisons to be made between the ralue of money incomes in different places, which is often an object of great practical interest, not only to indiriduals contemplating residential changes having to consider it, but governments and other large spending bodies, spending money in widely distant places, having to do the like. Apart from directly

\footnotetext{
- Report of the fifty-eighth meeting of the British Association for the Advancement of Science, 1888, page 181.
}
business issues of this sort, such questions are of obvious practical interest to economic students, and through them to the general public.
3. 'To enable historians and other students making comparisons between past and present to give an approximate meaning to the money expressions which they deal with, and say roughly what a given fine, or payment, or amount of national revenue or expenditure in a past age would mean in modern language. To the student of history from the economic point of view some such method of giving a meaning to money expressions is indispensable.

The above, it will be seen, contemplates the providing of a measure of (1) future payments; (2) payments at the present time but at different places; and (3) payments made in the past.§ All three involve, theoretically, the use of retail prices, and the commodities covered should be those of ordinary consumption combined according to their relative importance.
2. The money theory use.-The point of view above described involves no theory as to the cause of any change in prices which the index number may reveal. There is, however, a second use of index numbers which invades the realm of the theory of money, its specific object being to ascertain the extent to which the quantity of gold or other monetary standard in circulation may affect the general purchasing power of money. This use of the index number is chiefly celebrated on account of the brilliant series of essays by Jevons which appeared in 1863-9, in which, by an elaborate calculation, he endeavoured to ascertain the effect of the gold discoveries or 1848 on general prices in England. The use of an index number for this purpose predetermines certain features of its construction, as will be noted in passing further on. It involves, also, some knowledge of the demand which the several articles make respectively upon the currency. \(\ddagger\)

\section*{The Construction of an Index Number of Commodity Prices for Canada,}

In the present report the object has been to construct, in conformity with approved principles, an index number of prices for Canada covering the past twenty years. It may be added that, as explained in the introduction, it is the intention to carry the number forward from month to month in future in the Labour Gazette, the official journal of the department, and that the basis on which the investigation into the past has been conducted was framed with that intention in view* as well as with the obvious one of throwing a much needed light on perhaps the most widely dis-

\footnotetext{
§ In concluding its investigation the committee recommended the passing of an Act to provide for the establishment on an official index-number with the express purpose of making it lawful' in all contracts for payments in money to express that the payment is to be made for a given year in the proportionate index number for that year........in such sum of sterling money as will correspond in respect of the sum contracted to be paid to the proportion which the proportionate index number bears to the par index number.'-Reports, 1830, p. 488.
\(\ddagger\) The general problem sought to be solved by index numbers in this connection is described by Bowley (Elements of Statistics p. 218) as follows:-
'The problem, of which index numbers should give the numerical solution, may be compared to that presented to astronomers who estimate the motions of the sun by observing those of the stars. As the sun and earth move towards some distant point, say in the constellation Hercules, the stars have an apparent motion, due to the unperceived motion of the observer; those in the region of space towards which he is travelling appear to be spreading out; as the distances separating them gradually subtend wider angles, while those in the region from which he is moving appear to close together and those in directions perpendicular to the line of movement appear to move backward. Meanwhile all these stars have their proper motions, as rapid as that of the sun, but in as many directions as there are stars. On the whole there is a trend in the directions determined by the sun's motion, but in individual cases this trend is entirely lost. So when a change in the currency has a general influence on prices, this influence is concealed by the movements due to causes affecting only some of the commodities. In both cases it is possible to find the general trend, if sufficient accurate observations are available. In both cases the problem is complicated by the possibility of links connecting the movements of groups of the stars or of the prices.'
* In 1890, it may be noted, the Committee of the British Association recommended that 'governments should......direct existing Departments of State, to colléct a sufficient number of prices officially, to publish their prices officially, to deduce one or more index numbers from them, and to publish the variations in these index numbers annually or at more frequent periods.' British Association, Reports, 1890, p. 485.
}
cussed economic phenomenon of the present-the rise of prices of the past twelve years.

With regard to the purposes which the number, past and future, is expected to serve, it may be said that these are generally of the practical nature mentioned above, that is, to afford a means of measuring tendencies in the cost of living and an interpretation of the current trade situation as reflected in prices. For the former purpose, as already pointed out, retail prices are theoretically preferable. The present investigation, however, is confined to wholesale prices, because of their greater availability and accuracy, and because over long periods they show fairly enough the general trend of living expenses. \(\dagger\) In any event, they are to be preferred for the second object of the present index number-that of affording a barometer of industrial and commercial change.

In the notes which follow, the various problems encountered in the construction of an index number are briefly described in order, a statement being added in each case of the practice adopted in the present report.

\section*{Problems Involved.}

The construction of an index number of this kind involves three main problems:
1. The selecting of the commodities to be included in the number;
2. The obtaining of the quotations; and
3. The reducing of the statistics to a form which will show the relative signifcance of variations and which will permit of the combining of the quotations to show general movements.

\section*{(I.)-The Selecting of the Commodities.}

The selecting of the commodities to be included in the index number, though placed first on the list of problems, is determined in part by consideration that fall to be discussed under the second and third of the above headings. In the first place, as Professor Edgeworth remarks in this connection, beggars cannot be chosers: the availability of statistical records must sometimes determine what records are to be chosen. Again, when the question of the 'weighting' of the different commodities comes to be discussed, i.e., the allowance to gach of its relative importance, it will be seen that the number and distribution of the quotations play a large part in certain contingencies, and the method of calculation adopted must accordingly be allowed to exert a reflex action on the choice of commodities on grounds entirely of technical exigency.

Regarding for the moment the question of selection as apart from these considerations, and recalling the remarks above as to the purpose of the number, it may be stated that the choice of commodities in the present case has been made on the general principle of having the index number as representative as possible of the more im portant phases of Canadian production and consumption. The double viewpoint of production and consumption secures the inclusion of the main articles of import and export.

A question which any attempt to realize this end brings up at once is the question of the class of commodities to be included, more particularly whether both raw materials and manufactured articles shall be quoted. The point has been much debated. Notwithstanding the many difficulties involved in including manufactured articles (chief among which is the absence of permanent standards-an especially for-

\footnotetext{
\(\dagger\) It may be explained that the sost of living aspect of current price rariations is more fully covered in the Labour fiazette in a series of monthly returns of retail prices receirel from forty-six leading centres of population throughout Canada. Upwards of thirty staple varieties of foods are quoted in these returns in a was to reflect actual consumption conditions. A statement with regard to rentals is also given for each of the localities, the whole being interpreted by the application of a typical family budget.

On the general subject of the suitability of wholesale prices as compared with retail, see British Association Reports, 1585. pp. 183-4.
}
midable difficulty in Canada) their inclusion on a conservative basis in an inquiry like the present seems imperative. In the case of a large number of commodities, the manufacturing process represents practically their entire cost to the community. As Mr. Fountain remarks, the value of a watch spring is scarcely affected by the fluctuations in the cost of pig iron.* It is impossible, of course, to extend the list of commodities so as to include the countless specialized forms of manufactured articles demanded by modern consumption. But they may at least be represented. In the present number the effect of tendencies incidental to the manufacturing process are present in about 40 per cent of the quotations.

Having determined the class of commodities to be quoted, what shall be their number? The question shades very gradually from the foregoing. Practice in this respect has varied widely. The Economist number represents 22 commodities; Jevons', 39; Sauerbeck's, 45; Falkner's, 223; that of the United States Department of Labour, 261 ; and Dun's, 350 . On the one hand it woula seem that the ideal index number should include each and every article entering into consumption; on the other hand, apart from the plain impossibility of this, the labour of calculation and the danger of error must be restricted. The impossibility of covering every article increases the risk, in the case of a list extended beyond a certain point, of laying undue emphasis on particular lines. The report of the Committee of Finance of the United States Senate on Wholesale Prices, issued in 1893, included 23 quotations of pocket knives out of a total of 54 devoted to metals and implements, and three quotations of salted mackerel out of a total of four for all kinds of fish. While it is true that prices tend to vary in groups, it is clearly better, where possible, to obtain a fairly diversified list (i.e., comprehensive and typical in the true sense of the term) and to stop at a point where the selection begins to involve repetition or overlapping on any considerable scale.§ The number of articles cited in the present inquiry is 230 , though it may be pointed out that in a few instances-for example, in the case of cotton goods-the quotations represent the average of a large number of distinct lines.

The groupings of the commodities and the general principles governing the selection of the several lines quoted have been indicated in the introduction and need not be repeated here.
(2) The Obtaining of Price Quotations.

Wholesale prices may be obtained from three main sources:
(a). They may be taken from the records of actual transactions in the books of commercial firms, or from the published lists of reliable trade journals or other recognized authorities.
(b) The declared values of important articles of import or export may be taken and divided by the total quantities to show an average price.
(c) The contract prices paid for standard supplies by large public institutions, such as hospitals, government departments, prisons, \&c., may be selected.

\footnotetext{
* Fountain, however, argues strongly against the inclusion of manufactured articles. The standard objection to the entire omission of manufactured articles is that of Professor Nicholson, namelv. "that the system of treating raw materials as typical of all articles of consump-tion-as many of the most celebrated index numbers of the world do-fails to take into account the fact that the improvement in efficiency of labour has been much less marked amongst the agricultural and extractive classes than among the highly skilled classes employed in the manufacturing process, though the former's wages, having been drawn upward by the increase among the more skilled classes, are proportionately as important a factor in determining the price of the product of their labour, thus accounting for the fact that prices of finished goods tend to fall during a depression to a greater extent than those of raw materials.' The reply has been made to this that the economies in transport have been as important as the economies in manufacture, and that the cost of. transport affects raw commodities more in proportion to their value than it does the relatively higher priced finished article. The wages of labour being more stable than the price of raw materials tends to curtail the fluctuations of manufactured articles in comparison with raw materials.
§ For example: Sheepskins are not included in the present number under the heading 'Hides, leathers, \&c.' Unplucked, their value is determined largely by the price of wool; plucked, they follow very closely the fluctuations of lower grade leathers. The number of articles under 'Hides, leathers, \&c.,' namely 11, was considered sufficiently large, relatively to the total number included in the investigation.
}

In the present inquiry dependence has been had entirely on the first of these sources. For the more important raw materials and staple products the large daily papers of the better class compete in securing accurate markat reports, while the recognized trade journals are under a similar stimulus in the case of the more specialized lines. The practice followed throughout the investigation was, in the first place, to collect and collate the best available published information, and to submit the result for verification to long established firms at the wholesale centre in question.

The second source has been employed for verification purposes in the case of a few inportant raw materials imported by manufacturers direct from the primary world market and in which there is no wholesale trade in Canada. . Statistics of this kind have the advantage of showing what is actually paid for commodities, whereas market quotations must often represent an average quality and not necessarily the total or even the largest sales. On this ground they have the endorsation of the British Association.

The third method is not employed at all in the present investigation. Inquiry showed that in a number of cases the prices quoted to public institutions do not always reflect current trade conditions, but may, like retail prices, be swayed violently by local or particular circumstances. For example, the price paid for anthracite coal by a large institution in Ontario showed no change throughout the period of the 1902 strike in the Pennsylvania mines. In a later year a sudden and remarkable decline was explained by the outbidding of the first contractor by a second desirous of securing the additional business and advertisement which the contract involved.*

The primary requisite of a serfes of price quotations of a given commodity is that they apply to exactly the same quality throughout the period covered. It is clear that if, under the heading of wheat, we have at one time one grade quoted and at another time a different grade, the table is for comparative purposes meaningless, This is a difficulty which is peculiarly liable to occur when manufactured articles are included. Sudden changes in style, cost of production, and market conditions generally, account for this. In Canadian textiles, for example, little or no attempt has been made to fix standards. In the case of woollen fabrics, variations in the quality are as frequent as, if not more frequent than, changes in price. A rise in wages or in the price of wool is frequently met, not by a corresponding rise in the manufactured article, but by a cut in quality which enables the article to be sold to the trade at the same price as formerly. The trade itself seems to demand this practice, which may well cause us to regard with suspicion statistics of highly manufactured articles extending over long periods of time. In the present report, wherever such articles are quoted, care has been taken to see that changes in quality are accounted for in the prices given. \(\dagger\)

The prices quoted are for the most part those prevailing on the opening market day of each month, though if, in particular cases, these were found to be abnormal, an average of the week was taken.
(8) The Combining of Price Statistics.

Having obtained a series of quotations for a selected list of commodities, we now approach the problem of reducing them to a common basis of comparison and of combining them so as to show a generalized result-one of the most intricate tasks known to statistics.

As already stated, the initial step in the process is the reducing of the several quotations to the form of a percentage of a selected year or period. The selecting of this period is accordingly the first point to be settled.

\footnotetext{
- See also U. K. Report on Wholesale and Retail Prices, 1902, p. 42.
+ This method, of course does not attempt to take into account differences of quality of a grain crop from year to year, or variations in standard lines of pig iron, steel, de. traceable to slight variations in the ores, dc.
}

\section*{The Selecting of the Base Period.}

Practice has varied, ngain, in the matter of the base period. Several have used a single year. Jevons employed the year 1871; Falkner the year 1860; and the British Board of Trade the year 1871. The more usual course, however, has been to take a longer period: as a rule a five or ten year period. The Economist uses the years 1845-1850 as a base; Sauerbeck the years 1S67-1877; and the United States Department of Labour the years 1890-1899. The British Association recommends a ten year period as on the whole the best. \(\dagger\) The selection of the base depends, of course, to a large degree on the period covered by the statistics and the general object of tho number. Kral's index number, for example, was designed primarily to measure the effect of the demonetization of silver in Germany, and the year preceding that in which silver was demonetized (1871) was accordingly taken as the standard. As a rule some period near the beginning of the period under investigation is selected.

The difference in base periods accounts for the varying levels shown by several of the well-known numbers. The Economist's base period, 1845-1850, was a time of low prices, and the number has accordingly remained for the most part above 100. On the other hand, Sauerbeck's base period, 1866-1877, was a time of abnormally high prices, and his number has in consequence remained persistently below 100.

The present investigation was limited to the past twenty years for reasons that have been already explained, namely, that it is possible within these limits to go back some distance prior to the beginning of the recent rise in prices and thus obtain a sufficiently detached point of view. To this may be added the difficulty of carrying so wide a range of quotations, especially in the case of manufactured articles, to a more remote date, without danger of increasing hiatuses in the tables and without risk of inaccuracy.

Within this period it was decided to take the first ten years, \(1890-1899\), as a base or standard, for the following special reasons:-
(1) The years 1890-1899 were a period first of falling and then of rising prices; and though between 1890 and 1896 prices were probably lower than at any time in the closing quarter of the century, the recovery from 1897 to 1900 was very rapid, rendering the period as available, on the whole, as any, as reflecting normal conditions, within the limits of choice.
(2) A similar investigation by the United States.Department of Commerce and labour, begun in 1902 and carried on from year to year since, employs the closing decade of the nineteenth century as its base period; and as the commodities covered in the two investigations are in a large number of cases the same, comparisons between the two countries are rendered much easier by the employment of the same base period. Prices estimated on different bases may, of course, be reduced to a common standard, but the labour is great. The contiguous position of the two countries, and the similarity of economic and trade conditions in both, render the study of comparative prices as between the two exceptionally inviting and worthy of being facilitated wherever possible.

\section*{The Obtaining of an Aggregate Result.}

Having selected a base period, and having reduced the actual quotations to the form of relative prices, the great problem of the index number is faced: How are these individual percentages to be combined into an aggregate result or series of results?
(A simple but indefinite way of arriving at a conclusion is to observe the number of quotations that show a rise and the number that show a fall and to be guided by what is indicated in this way as to the general movement. This, however, affords no exact criterion as to the extent of the movement in one direction or the other and permits only a rough statement at the best. A statement of the kind will be found in the introduction.)

The first and obvious method is the simple one of averaging the various percentages shown for a particular year or period and regarding the result as indicating the

\footnotetext{
† Reports, 1890, page 483.
}
general movement. Thus, if the index number of wheat in a certain year is shown to be 110 and that of indigo 120, the index number for both might be expressed as 115 .

This, however, at once raises the objection, that to combine on a basis of equality articles of such varying importance as wheat and indigo (the former of which is estimated in the case of Great Britain as bulking more than eighty times larger than the latter in the commerce of the country) is to give an altogether disproportionate influence to indigo. An increase of 10 per cent in the price of, say, flour, would probably involve several dollars increase in the yearly expenditure of a normal family, whereas a much greater proportional increase in the price of, say, pepper, would involve no more than a few cents additional outlay. Clearly, it would seem necessary in combining such commodities to make careful allowance for this marked divergence in their relative importance.

This constitutes the problem of 'weighting,' so-called. By 'weighting' is simply meant the giving to each commodity, in the act of combining statistics to form an index number, an importance equal to the importance of the commodity in the consumption or trade of the country. Thus, if barley is ten times as important as flax seed, any variation in the price of barley must, in framing an index number, be accounted as of ten times the importance or 'weight' of a like variation in the price of flax seed.

It will be seen, therefore, that the first step to be taken in constructing a weighted index number is to determine the ratio of importance to be given to the several commodities included in the number. This is usually done by adding statistics of production and of imports, in the case of each commodity, and substracting from the sum the value of exports. The result is regarded as the amount consumed, consumption being held to include the manufacturing process.*

\section*{' Fixed' and ' Fluctuating' Weights.}

Having fixed upon the weights to be assigned to the several commodities, there are, broadly speaking, two methods in which a system of weighting may be applied in working out an index number, according as the weights used are 'fixed' or 'fluctuating.'
(1) By the method of 'fixed' weights the relative importance of the several comnoditics at some particular date or period is determined, and the result applied to the percentages from year to year. Thus, wheat being found at a certain period to be, say, eighty times, and oats, say, ten times as important as indigo, the index number for wheat would be multiplied by eighty and that of oats by ten in calculating the combined number. Usually the relative importance of the several commodities in the year or period taken as the standard is ascertained; the quantities consumed in the base year are then reckoned, first, in the prices of the base year, and then in the prices of the current year, the ratio between the two products giving the number. This is the plan pursued in the well-known report of Sir Robert Giffen on export and import prices published in 1885.
(2) By the method of 'fluctuating' weights three plans are feasible:
(a) The first is the method made famous by the investigation of Mr. R. H. Inglis Palgrave, included in his memorandum to the Committee on the Depression of Trade and Industry in 1886. Palgrave's method was to estimate the relative importance of the several commodities included in the number from year to year and to apply these weights to the various percentages. The number would therefore reflect both the price and the varying quantities consumed of the several commodities. The chief objection to this is the immense labour entailed and the cousequent danger of error, an objection emphasized by the fact that under the most favourable circumstances many of the weights can be no more than approximations. A second objection is that a mere change in the proportion of the articles consumed may involve a change in the number, though no change in price may have occurred. A third objec-

\footnotetext{
- As a matter of fact, however, several important commoditien do not lend themselven to treatment in this way and various estimates of a more or less make-shift character have to be resorted to. Thus Palgrare in calculating the weights for several articlen in his index number was compelled to take a rough estimate of national production and to consider this constant. A most valuable discussion on the calculation of weights in that of Mr. R. L. Nash. embodied in Palgrave's report to the Royal Commission on the Depression of Trade in 1836.
}
tion is that the calculation of a yearly consumption weight leaves out of account all question of stocks. It is extremely doubtful if any system of calculating weights based on a single year can be relied on to reflect consumption in that year. The elaborate calculations of Palgrave would seem, therefore, to be in the way of a refinement.
(b) The second plan is to regard the index number as the ratio between the quantities consumed in a current year or at current prices and the same quantities at standard prices. Mr. Sauerbeck has used this method by way of testing his unweighted number. In the case of Mr. Sauerbeck's number little change was shown between the weighted and the unweighted mean. For example, Mr. Sauerbeck found that the total value of the quantities of each article included in his number consumed in 1897 was \(£ 464,200,000\); the value of the same commodities at the price of 18561577 was \(£ 731,500,000\). The proportionate price for 1897 was, therefore, \(62 \cdot 5\). The simple average index number for 1897 was 62.0 . The method, like that of Palgrave, involves the calculating of a new series of weights each year.
(c) The third plan is that recommended by the British Association Committee, namely, to employ a series of weights based on the average national expenditure on each article during the current year and a few years preceding, expressing the results in round numbers.*

\footnotetext{
-The following table shows the weights suggest d on this plan by the Association Committee for an official index number covering twenty-nine series of quotations:-
}

BRITISH ASSOCIATION'S TABLE OF WEIGHTS FOR THE CONSTRUC'CION OF AN INDEX NUMBER.

\footnotetext{
The following explanation is added:
'In this table the first column indicates six leading genera which comprehend the twentyseven classes of articles specified in the second column. These articles are either finished
}

As a still further variation on the above, Professor Marshall, in an article in the Contemplorary Review for March, 1887, recommends that each year should be compared only with the preceding one and the average consumption for the two years be taken as the weight.

On the subject generally of fixed vs. fluctuating weights, it may be said, with Fountain, that the question of the continuance of the same series of weights depends largely upon the period under review. In a period of rapid changes, frequent revision in the weights would seem more necessary than in one of comparative stagnation.

\section*{The Budget Method of Weighting.}

Another system of weighting is the 'budget' method, which, though it usually involves the employment of a fixed series of weights, and might, therefore, have been considered above, is determined by means so different as to stand in a class by itself. By this system the weights assigned to the several commodities are derived, not from trade statistics, but from observation of actual consumption. The expenditures of a large number of families are noted, and the data reduced to an average and regarded as representing the consumption of a 'typical' family or individual. It will be seen at once that this system must necessarily apply best to retail prices, in the terms of which household and personal expenditures are reckoned. Even where the information is considerably minute it cannot be applied directly to a collection of wholesale prices. 'Rent' is a large item in family expenditure, but how is this to be estimated in terms of bricks, lumber, paint, \&c.-the only items which correspond in the usual wholesale list? Again, pig-iron, raw cotton, raw rubber, \&c., do not appear in the ordinary family budget. Even in the case of foods, it will often be found that various items in family budgets do not correspond with those in a list of wholesale products. The application of a series of weights obtained by the budget method to any list of wholesale prices accordingly requires a large amount of manipulation, though undoubtedly the method is most interesting and valuable. A well known experiment of the kind is that of Professor Falkner, the statistician of the Finance Committee of the United States Senate, in the report of that body on wholesale prices made in 1893, which is described in some detail further on. The method, of course, cannot lay claim to more than approximate accuracy, though a criticism expressly made of it, viz., that the individual is a law unto himself and that 'average' calculations of price fluctuations no more fit the individual than would a hat or a suit of clothes of 'average' size, does not seem more warranted in this case than in any which depends on generalizations for a result.*

\section*{Method of Weighting in Present Report.}

In view of the foregoing it would seem strongly advisable, not only that a weighted index number should receive the preference, but that care should be taken in the choice of the particular method of weighting. The dictates of common sense

\footnotetext{
products (things ready for consumption, like cheese and milk) or represent such things by
entering into their production, as coal (used in manufacturing) and timber, for instance, on to the production of houses and furniture.
'The third column gives in round numbers ( 000,000 's being omitted) the average national expenditure on each class of article at present and for the last few years, and presumably also for the immediate future the proportions at least, if not the absolute amounts, of expenditure (such proportions, as shown in Mr. Gilfen's reports on the rariation in the prices of exports and imports, remaining pretty constant during a period of years). In the estimated amount of consumption allowance is made for the addition to the ralue made before the articles are in the form in which they are finally consumed.
' In column 4. these amounts (or propertions) are reduced to percentages (of the total amount expended on such articles).
'In column 5, the relative importance proposed to be assigned to each article in the index number is stated, mainly on the basis of the percentages in column 4, but with modifications so as to substitute even figures for the convenience of hadling.
- For a discussion of the budget method of weighting, see Laughlin's 'Principles of
}
and the abstract reasoning of the mathematician alike appear to support this view. Nevertheless, in proceeding to the actual problem, one is met on the threshold by the fact that, however strong in theory the argument in favour of a system of weighting appears, in practice many of the most important considerations urged for it tend to disappear. Not only has it been demonstrated by numerous experiments that differences between the various systems of weighting are slight; but the difference between any one of them and no system at all is little. Mr. Fountain in describing the case says: 'In normal years when nothing of an exceptional character occurs to affect to any great extent the general level of prices, the adoption of a scientific system of weighting is rather for the purpose of anticipating theoretical criticism than because of the practical difference in the result.' The committee of the British Association itself, while recommending a weighted mean as on the whole preferable, no less unequivocally expresses the view that for general purposes the unweighted mean might very well be considered to answer all requirements. The final opinion of Sir Robert Giffen is: 'The articles as to which records of prices are obtainable being themselves only a portion of the whole, nearly as good a final result may apparently be arrived at by a selection without bias, according to no better principle than accessibility of record, as by careful attention to weighting. Practically the committee would recommend the use of a weighted index number of some kind, as on the whole commanding more confidence. A weighted index number, in one aspect, is almost an unnecessary precaution to seoure accuracy, though, on the whole, the committee recommend it.'§

In addition it may be urged that the unweighted mean undoubtedly possesses the merit of simplicity of preparation and of freedom from mysterious technicalities which tends so strongly to command confidence. Moreover, if the object aimed at is to express the general tendency in prices underlying all variations, then the changes in the value of relatively unimportant articles may be as significant for the purpose as the changes in the value of the most important.

Regarding the above opinions of Mr. Fountain and Sir Robert Giffen as the concensus among statisticians, it will be seen that the use of a weighted mean is called for only in two contingencies: (1), when the general trend of prices is interrupted violently by circumstances of a special character, as in the United States during the civil war of 1861-1865, or in Europe during the Franco-Prussion war, 1870-1872; and (2), when the number of commodities included in the survey of prices is limited.

In the present report the index number has been calculated on the simple arithmetical average method of giving each commodity equal importance. The list of articles, it is considered, is sufficiently extended and well distributed to overcome the need for weighting based on the limited number of commodities included in the number; nor has there occurred in Canada in the past twenty years any such violent interruption of normal economic conditions as to render weighting necessary to meet the other contingency mentioned.

In the choosing of the commodities, though duplication has been avoided, it will be found that several important articles, owing to the scope of the investigation, are

\footnotetext{
Money' chap. VI. See also articles by Professor Pierson in the British Journal, Vol. V., p. 231, and Vol. VI., p. 109. Professor Pierson was answered by Professor Edgeworth, Ibid., Vol. VII., p. 132.
§ Edgeworth in his essay on the accuracy of index numbers (B. A. Reports, 1888, p. 188) has calculated an index number for the year 1885 by seven different methods of weighting and found them to be \(70,70 \cdot 6,73,69,72,72\) and 69.5 . The discrepancy which is as likely to occur as not, amounts to only \(2-2 \cdot 5\) per cent, while the discrepancr which is very unlikely to occur is from 8 to 11 per cent. See also report of British Board of 'Irade, Wholesale and Retail Prices, 1906, p. 448, for an interesting experiment showing the slight, effect of widely different systems of weighting. See also Bowley's 'Elements of Statistics,' pp. 221-223. 'The error resulting from errors in weighting,' says Bowley, ' is in many cases, much smaller than the error resulting from faulty measurements of the quantity weighted.' Edgeworth's calculation of 1588 proves that 'the inaccuracy of the price-returns affects the result more than the inaccuracy of the weights; and the inequality of tho price-returns more than the inequality of the weights.--(B. A. Reports, 1888, p. 199.)
}
represented indirectly more than once. Thus, wheat is represented in two quotations for wheat itself, in quotations for bran and shorts, in quotations for four varieties of flour, and in a quotation for soda biscuits, nine series of quotations in all. Coal, similarly is represented in pig-iron, lumber in furniture, \&c. This illustrates the manner in which an extended list of articles tends to weight itself.

By way of experiment, and with the object of testing the simple arithmetical average obtained as above, a series of group weights, based on the table suggested by the British Association committee, with some slight modifications to meet the grouping adopted in the present investigation and the different standards of consumption in this country,§ were applied to the statistics. The results of this experiment and the table of weights on which they are based are embodied in the introduction.

A problem akin to that of weighting arises in dealing with commodities the price of which is largely governed by seasonal conditions. It is clearly inaccurate to quote, say, fruits out of season, and to assign to the quotations the same importance as to those of the same fruits when in season. This has been avoided in the present report by quoting such articles only in the months in which they are largely marketed. In cases where different varieties are quoted in different months, the number has been calculated separately.

\section*{Calculation of the Averages.}

It remains to be pointed out that in calculating the averages of the various relative prices, whether weighted or unweighted, more than one method may be employed. Up to the present, mention has been made only of the arithmetical mean or average, as the method which naturally first suggests itself. Two other methods, however, have been used by eminent authorities and have had much said in their favour:
(1) The use of the geometric mean.-This first received the stamp of approval from Jevons. It has recently been strongly commended by Walsh, \(\ddagger\) one of the latest to treat of the subject. The original argument of Jevons was as follows:-
"The price of cocoa has nearly doubled since \(1845-18\) š0. It has increased by 100 per cent, so that its variation is now expressed by the number 200. Cloves, on the contrary, have fallen 50 per cent and are now 50 . The arithmetic mean of these ratios would be 125. The average rise of cocoa and cloves would then appear to be 25 per cent. But this is totally erroncous. The geometric mean of the ratios, expressed by the number 100,200 and fifty is 100 . On the average of cocoa and cloves there has been no alteration of price whatever. In other words, the price of one has doubled, of the other halved-one is multiplied by two, one divided by two-on the average, then, the prices of these articles remain as they were." \(\dagger\)
To take the geometrical mean of two ratios it is necessary to multiply them together and to extract the square root of the product. Jevons accomplished this by turning the numbers into their common logarithms, the arithmetic mean of which is the logarithm of the geometric mean required.

The method of Jevons was criticised by Laspeyres, Professor of the University of Basle. Laspeyres urged that as the value of gold means its purchasing power, the simple arithmetical average of the quantities of gold necessary for purchasing uniform quantities of given commodities should be taken. For example, if the price of cocoa has advanced from 100 to 200 , and the price of cloves declined from 100 to 50 ,

\footnotetext{
§ In the absence of statistics directly bearing on consumption standarda in this country, apart from statistics of import and export trade and of production, use has been made of the special studies of family expenditures of the British, United States, and Massachusetis Labour Departments. See the Eighteenth Annual Report of the U. S. Commissioner of Labour, 1903, p. 15 ; the Twenty-second Annual Report of the Bureau of Statistion of Labour of Massachusetts, 1901, p. 254; and Special Report of the Board of Trade, Qreat Britain, 1901.

I'The Measurement of General Exchange Value, chap. VIII.
t'Currency and Finance' p. 23.
}
it requires 250 to buy the quantities of each that were previously bought for 200 . That is, prices have advanced 25 per cent. Jevons admitted, in reply, that there were grounds for this argument, and suggested that the harmonic mean might be a still more accurate average. The reasons for his own adoption of the geometric mean he explained as follows:- (1) It lies between the other two; (2) It presents facilities for the correction of results by logarithms, and (3) It seems particularly suited to measure changes in prices due to a change on the part of gold. The geometric mean certainly has the advantage of being less liable than the ordinary average to be unduly affected by extremely high prices. The fact that rises in prices are more frequent and extreme than falls adds force to this statement. Edgeworth has further expressed the view that the results of the geometric mean are independent of the year chosen as base.

Walsh has answered Laspeyres in an exceedingly subtle and elaborate argument, to which Professor Laughlin has replied. \(\dagger\)

Sauerbeck experimented with the geometric mean for the years 1895, 1894 and 1880, with the following results:-

(2) The use of the median.-Another kind of mean, advocated by Professor Edgeworth as having some of the advantages of the geometric and as being free from the Iatter's essential disadvantage of cumbersomeness, has been termed the median. This is formed by arranging the various items in the order of magnitude and taking the middle quantity, that is, the figure which has as many of the items above as below. In practice the median is found not to differ widely from the arithmetic mean, but to have the advantage in the case of extreme variations of diminishing the influence of the extremes. It may thus help to offset the effect of a bad choice of commodities.

The method pursued throughout the present investigation has been to take the simple arithmetic mean, in accordance with preponderance of usage, leaving for the future any experiments with other methods which may be suggested by special conditions.

\section*{Changes in the List of Articles.}

As already stated, it is the intention to include in the future index number of the department certain articles concerning which complete information could not be obtained in time for the present report, e.g., flax, tea (black, Indian), asbestos, mica. British Columbia fir, and paper. The inclusion of these in the index number will involve no difficulty where it is possible to secure a line of quotations back to 1890. Where, however, as in the case of certain articles already in the number, this is not found possible, owing to poverty of records, changes in industrial methods or consumption standards, \&c., a difficult problem arises owing to the nevessity of having all the percentages entering into the number on the same basis.

In a number extending for any length of time this is a difficulty which is bound to occur and it is one for which no satisfactory solution can be found. In the present report, for example, no quotations of dressed meats were obtained at Toronto, Ont., prior to 1902, owing to the fact that the wholesale meat trade reflected in these prices did not exist prior to the last few years, the local butchers either slaughtering their animals themselves or having them slaughtered in a common abattoir. Similarly, no satisfactory record of hemlock lumber at Ottawa was obtained owing to the fact that hemlock is largely employed as a substitute for the cheaper grades of pine, and it was not until the high price of pine during recent years had largely increased the consumption of helock that systematic quotations of the latter were published. Calcium carbide is an example in the list of an entirely new commodity coming into existence.

\footnotetext{
† See Laughlin's 'Principles of Money,' pp. 147-156.
}

In reckoning the index number in these and similar cases the method followed was to assign to the new commodity the index number of the commodity displaced or most nearly represented in the year in question. Thus the index number of the lowest grade of pine lumber was assigned to hemlock in the year in which that article first makes its appearance in the quotations. In this way the new commodity creates a minimum of disturbance in the index number of the year in which it first occurs, whilst subsequent variations make themselves duly felt. An explanation of the exact procedure followed in each case of the kind will be found in a foot note to the tables of index numbers.

\section*{II.-REVIEW OF BRITISH AND FOREIGN INDEX NUMBERS.*}

The remainder of this memorandum consists of a brief revier of the most celebrated index numbers of prices that have been published in Great Britain and foreign countries, to which are added some remarks of a general nature as to the limitations of index numbers and the part to which they are confined in the elucidation of the problems arising out of changes in prices.

Inasmuch as the wholesale price of many staple commodities is determined by world conditions, the present situation is one which Canada shares to a large degree with other countries. Statistics of recent price fluctuations in these countries are

\footnotetext{
- The present review is limited to calculations made during the last half century by the means of index numbers and does not deal with the extensive literature on the history of prices. The following references, however, to some of the results of these larger historical inquiries will be of interest.

For a useful résumé of the history of prices in ancient, mediaeval and modern Europe, see Palgrave's Dictionary of Political Economy, articles 'Prices' and 'Wages'.

For England, the histories of Thorold Rogers, Young and Tooke enable the course of prices to be followed with precision from the year 1359 to 1850 . Briefly, during the first century of this period, no remarkable change in price level occurred; following the Black Death (1348-9, 1361-2, and 1368-9), however, wages advanced very rapidly, and prices slowly, for fifty years; there followed a century and a half (1460-1540) during which prices remained steady, while wages maintained their previous gains; this was succeeded by a period of forty fears ( \(1545-1585\) ) during which prices showed the enormous gain of one hundred and fifty per cent, while wages advanced but sixty per cent-the chief causes assigned being the debasement of the currency by Heury VIII, and the inflow of American silver; the rise thus violently begun continued more slowly until the middle of the seventeenth century, after which it moderated greatly for sixty years, while the upward trend of wages was accelerated; from 1700 on, a gradual rise in prices and a relatively more rapid advance in wages took place until about the time of the American Revolution; after the latter date the rise in prices became very rapid, so that, comparing the first two-thirds of the eighteenth century with the first decade of the nineteenth, prices were increased to two and one-half times their previous level, while wages were doubled.

The following tables quoted from Palgrave's Dicticnary of Political Economy are illustrative of the above statement:-
}

ENGLISH AVERAGE PRICES.
(From Roger's "History of Agriculture and Priccs.")

Nore.-The figures given for "Wages of Lisourer " before 1400, are those of the thatcher, probahly
therefore of direct interest in connection with the present report. The statement which follows is designed to place at the disposal of the Canadian public, in accessible form. the important body of price statistics collected and presented in accordance with the method of index numbers above described in Great Britain, the United States and on the continent of Europe.

A description is given in the case of each number, by way of supplementary explanation of the earlier matter of this memorandum, of the method by which the number is obtained, the particular object it attempts to serve, its histors, \&c.

For convenience of reference, the matter relating to the history and technique of the number, and the results shown by it, are presented under separate heads.

For a brief critical commentary on the history of prices in England see Nicholson, 'Principles of Political Economy,' Vol. III. Book IV. chapters 3 and 4; see also Mulhall's History of Prices, a work designed to supplement the researehes of Tooke and Newmareh, as the latter had supplemented those of Young.

For a discussion of cost of living in England during the past six centuries, see Thorold Rogers' History of Prices,' Vol. I., chapter 29, on 'the purchasing power of wages, 'in which an estimate is given of the way in which a stated annual income might be spent: (1) during the period preceding the plague; (2) during that which followed the plage; (3) in the middle of the eighteenth century; and (4) in the first twenty years of the nineteenth century.

With regard to the course of prices since 1800 , full information may be gathered from the index numbers reprinted herewith. From 1810 to 1845 , the tendency was downward; from 1850 to 1873 upward; from 1873 to 1896, downward; and from 1896 to the present, upward. Speaking of the prolonged and pronounced downward movement between 18.3 and 1596, Professor Lindsay says:-

It seems to be contrary to all past experience. In spite of better statistical facilities for measuring it, and a more uniform basis of comparison between various markets, owing to development in transportation facilities, than probably existed in any earlier period, there is far less agreement as to the causes of this persistent downward movement in general prices. The demonetisation of silver by Germany, and later the attempt of all the leading commercial nations to establish the gold standard on a firm basis, and a corresponding distrust of silver for monetary purposes, is one reason alleged for the movement in prices since 1873. Reduced cost of production, improved processes and increase of capital, and the enormous increase in the use of machinery in all lines of industry, are also causes alleged to account for these changes. Greatly reduced cost of transportation and superior organization of industry under the management of the joint stock company are still other causes enumerated.' (Palgrave's Dictionary of Political Economy, article 'Prices.')

\section*{Early Calculations.}

Sir Robert Giffen and others mention the Chronicon Preciosum of Bishop Fleetwool (1707), as showing changes in the value of mones from century to century by a system of averages in which each article is considered as of equal importance. Fleetwood set out to discover how much food, drink and clothing could be purchased by a perpetual income of five pounds in the years 1440-1460, compared with the sum required to purchase the same goods in 1700. His conclusion was that 'five pounds two hundred and sixty years ago was equivalent to twenty-eight or thirty pounds now.*' Adam Smith, with a much nearer approach to scientific accuracy, traces the variations in the monetary standard during the four centuries preceding 1750 by an exhaustive examination of corn prices. His estimate is based on wheat alone, the argument being that, inasmuch as population keeps pace with subsistance, the cost of wheat is less liable to vary than is that of any other commodity. § Though wheat as a commodity was of relatively greater importance in the earlier centuries, the use of a single article for a purpose of this kind was a serious limitation. Moreover, the subsequent researches of Professor Thorold Rogers have overthrown the earlier portion of Adam Smith's results. Sir George Shuckburg Evelyn, a fellow of the Royal Society, adopted a more scientific method in a table of prices dating from the Norman Conquest to the end of the eighteenth century, which he published in 1798. The results of Evelyn's investigation are shown in the diagram on the following page. \(\ddagger\) Our review of index numbers proper, however, may begin with the more modern ant comprehensive calculations.**

\section*{The London 'Economist's' Index Number.}

History and method.-Perhaps the most frequently quoted index number in the world is that of the London Economist. This had its origin in an article published in 1859 by William Newmarch, the eminent economist and statistician, in the Journal of the Royal Statistical Society, in which the prices of nineteen commodities, quotel from the Economist of the preceding year, were analyzed in terms of the average prices prevailing during the period \(1845-1850\). Newmarch had collaborated with Tooke in the final volume of the latter's 'History of Prices,' and his review of 1859 followed the arrangement of the former investigation. The period \(1845-1850\) was selected as a basis, as being prior to the disturbances effected by the gold discoveries. In similar papers published in 1860 and 1861, Newmarch increased the number of commodities to twenty-two.

It was not until 1864, however, that the Economist in its ammal commercial history, published for the first time in that year and written by Newmarch, adopted the price calculations which until then had appeared only in the Journal of the Royal Statistical Society. The commodities included were as follows: coffee, sugar, leu, tobacco, wheat, butcher's meat, raw cotton, raw silk, flax, hemp, wool, indigo, oils, timber, tallow, leather, copper, iron, lead, tin, cotton wool, cotton yarn and cotton cloth. London and Manchester markets were quoted. At first the percentages of tho several commodity prices were stated separately. In 1569, however, they were added together and became the Economist index number, which has been continued since that date.

Although only twenty-two series of percentages are included in the Eiconomist's number, two or more price quotations are in some instances given as a single series. Raw cotton and butcher's meat, for example, are each allowed four series of price quotations: oils are given three: and sugar. flax, hemp, wood, timber and iron, two each; bringing the total number of series to thirty-five. It is not claimed, however, that the result approximates to a system of weighting, inasmuch as it leaves several commodities of very different relative importance with similar or very imperfectly

\footnotetext{

}
'008t-0g0t 'sәo!

adjusted weights. In this respect the following standing note of the Economist explains the number:

The total index number does not, of course, present a full and accurate representation of the variations in prices, inasmuch as it can not allow for the relative importance of the different articles. Wheat, for example, reckons for no more in the total index number than indigo; and during the years of the high price of cotton and cotton fabrics the total index number is, in a measure, unduly raised by that special cause. Still, the total index number, read with the needful qualifications, may afford important inferences.

The high figures to which the Economist number rose during the American civil war on account of this overbalancing of cotton have been frequently pointed out.

A greater defect is that the Economist's quotations are in some cases those only of a given day and not averages for the year. The omission of coal is also serious.

Results.-The table below shows the fluctuations of the Economist's number from year to year since 1868. By dividing each number by 2,200 the percentage is shown.

\section*{Jevons' Index Number.}

History and Method.-As already remarked, Jevons' index number remains the most celebrated example of a number constructed with the definite object of measuring the rise and fall of gold as a purchasing medium. Struck while comparing some statistics of prices in 1863 by the enormous and almost general rise which had occurred about ten years previously, Jevons was led to suspect an alteration in the standard of value as the explanation. The change he thought might be attributed to the gold discoveries of 1848-1850.

His first discussion of the question was in the essay, 'A serious Fall in the Value of the Gold Standard ascertained and its Social Effects set forth,' published in 1863. The successive papers of Newmarch in the journal of the Royal Statistical Society were the immediate inspiration of Jevons as to method. The period covered and the base period selected were the same as those of Newmarch. The number of commodities, however, was increased to 39 , and in some parts of the investgiation to 118. Weighting was disregarded, on the grounds that, where the object of search is to reach the cause or tendency underlying all prices, one commodity is as good as another. A similar explanation accounts for the elaborate precautions taken throughout to measure such influence as the effect of periodical commercial tides, \&c. But the most interesting departure made by Jevons was in his use of the geometric instead of the arithmetic mean in determining his averages. This has already been touched upon. Jevons' original explanation of his reasons for employing the geometric mean left something to be desired in clearness. In a subsequent essay, published in 1865, entitled, 'The variation of prices and the value of the currency since 1782,' replying to the criticism of Lespeyres, he went into greater details. In the second paper also, the scope of the previous inquiry was greatly enlarged. Using the tables of prices contained in the Tooke-Newmarch 'History of Prices,' the investigation was now carried back to 1782 , and a wealth of material added to his previous treatment of the causes and effects of price variations.

As a sample of the captivating way in which this intricate and technical subject is discussed, and as of more than passing interest at the present time, the following extracts descriptive of the manner in which, as Jevons held, the depreciation of gold makes itself felt may be cited:-
'The alteration of the ralue of gold must be most gradual and gentle in its effects. Far from taking place with sudden and painful starts, flinging the rich headlong down to a lower station, and shaking the groundwork of society, nothing is more insidious, slow and imperceptible. It is insidious because a rise in the price of any article, when observed, is naturally attributed to a hundred other causes than the true one. It is slow, because the total accumulations of gold in use are but little increased by the addition of any one or of sereral years. It is imperceptible because the slow rise of prices due to gold depreciation is disturbed by much more sudden and considerable, but temporary, fluctuations, which are due to cominercial causes, and are by no means a novelty.
' It is almost impossible, too, for any person to detect the effects of the change of standard in his own personal affairs. Each individual has his own fluctuations of prosperity and adversity. If his income is not variable, at least his expenditure is more or less so. There are a hundred items of expenditure, some increased, some diminished. If his receipts are variable and increasing, he enjoys the consciousness of prosperity, and probably attributes it complacently to his own abilities and deserts. If his income consists of fixed dividends, he receives the same pieces of money as before. It is when he comes to pay his household bills that he can alone feel the difference. And then the difference seems to arise from the deficient harvest, from the growth of population, from the extortions of tradesmen, from anything rather than the change of a British sorereign fresh from the mint. Value is the most invisible and impalpable of ghosts and comes and goes unthought of while the visible and dense matter remains as it was. So it certainly has been, I think, in the last fifteen years.'

In a short paper contributed to the Economist in 1869* Jevons reiterated his former position as follows:-
' I cannot help reasserting with the utmost confidence that a real rise in price to the extent of 18 per cent. . . has been established since the year 1849. While statisticians have been disputing, society has practically accepted the fact of a rise. The pay of the army is increased, the whole of the civil service and the staff of the Bank of England receive larger salaries, and could the information be obtained, I believe the same change might be shown to have occurred in most private establishments. Trade unionists point to the services rendered by their societies in gaining a rise of wages. Financial reformers, on the other hand, point to the great increase in the public expenditure of the kingdom as a proof of extravagance. To all these effects the alteration in the value of gold has, I believe, contributed something; it would not be too much to say, that the increased cost of materials and wages has added three or eren five millions to the public expenditure, and wages not umnaturally rose when gold was perceptibly depreciated.'

\section*{Palgraves' Index Number.}

History and method.-Mr. R. H. Inglis Palgrave's number is celebrated chiefly on account of the extraordinary effort it represents to secure accuracy of weighting. It was published in a Memorandum prepared for the Royal Commission on the depression of Trade and Industry, 1886, appearing as an appendix to the third report of the Commission. Briefly, Mr. Inglis Palgraves' object was to remedy the lack of weighting in the Economist number by the application of a series of weights based on an estimate of the value of the quantity of each of the articles consumed each year in the United Kingdom. This being a variable factor from year to yoar, Palgrave's method, as already explained, is one of fluctuating weights. It differed considerably from that of Drobisch, a German economist who had previously employed a somewhat similar method, though the principle involved in both was the same. Drobisch derived his number by the simple process of multiplying the price per unit in each ease by the number of units consumed; wherens Palgrave multiplied the ratio of the numbers of the two years under comparison by the consumption value in the second. As Palgrave's primary object was to compare the course of prices in Great Britain with those in France, India, and other countries, he was unable through lack of available statistica to go back further than 1865, the period 1865-1860 being used as a base.

Results.-Reducing the Economist's number to his basis and recalculating the resulting numbers according to their relative importance as determined in the manner above described, Palgrave obtained the following:-

ECONOMIST'S AND PALGRAVES' NUMBERS.
[Number of articles-2?.]
[Average Price, \(1865-1869=100\).]

The above may be graphically represented as follows:-

CHART SHOWING THE COURSE OF PRICES IN GREAT BRITAIN FROM 1865 TO 1885, BASED ON THE ECONOMIST'S AND PALGRAVE'S INDEX NUMBERS.
[ Number of \(A \uparrow t i c l e s-22]\).
[Average Prices, \(1867-1869=100\).

It will be seen that though in individual years, as in 1866, 1871, 1874 and 1876, divergent tendencies are shown, the general direction of the two lines is the same. Much has been made of this as contirming the general accuracy of the simple average system of index numbers. In view of this and of the enormous difficulties encountered by Palgrave in determining the relative importance of certain articles,* it has been generally conceded that the result does not justify the lahour of calculation involved The experiment has not been repeated.

\section*{Sauerbeck's Index Number.}

An index number which is second in reputation only to that of the Economist, if indeed it is second to any, is that of Mr. Augustus Sauerbeck, a London wool broker. The number was published for the first time in 1886, in the Journal of the Royal Statistical Society, § and has been continued from year to year since. Mr. Sauerbeck's purpose was to establish a broader basis for calculation than that of the Economist, in view of the remarkable fall in prices which took place between \(15 \% 3\) and 1885. Altogether, forty-five articles, or series of articles, were included, no commodity being taken of which the value consumed per annum fell below \(£ 1,000,000\). The base or standard price is the average for the eleven years 1867-18\%\%.

The commodities are divided into six groups, as follows:-(1), vegetable foods (wheat, flour, barley, oats, potatoes and rice) ; (2), animal foods (beef, mutton, pork. hacnn and butter) ; (3), sugar, coffee and tea; (4), minerals, (iron, copper, tin, lead and coal) ; (5), textiles, (cotton, flax, hemp, jute, wool and silk); (6), sundry materials. (hides, leather, tallow, oils, suet, nitrate of soda, indigo and timher).

Mr. Sauerbeck for test purposes has worked out certain results with percentages weighted according to national consumption. His general method, however, has been to treat each of the forty-five commodities as of.equal importance. A certain rough weighting is aimed at by employing a greater or less number of quotations according to the general importance of the commodity. Thus, three quotations are given of wheat, whereas barley, oats, \&c., have but one. Though two brands of coffee arm quoted, the mean of the two index numbers is taken, so that the weight of a single quotation is given to this article. This, however, cannot be said to constitute weighting. Mr. Sauerbeck laying first stress on the selection of his commodities, and employind veights only from time to time to ensure the accuracy of his number as indicating yeir since 1846 , while a similar number based on a similar list of commodities the general course of prices. Mr. Sauerbeck has calculated his number for every year since 1846 , while a similar number based on a smaller number of commodities has been prepared back to 1818.

The following table gives a list of Mr. Sauerbeck's index numbers for the entire period covered by his investigation, viz.: - 1818 to 1908.

\footnotetext{

\hline - & & & & 1908 ..... & 73 \\
\hline
\end{tabular}

The significance of the above will be seen at a glance from the chart on the next following page.

\section*{Index Number of the Board of Trade, Great Britain.}

Mistory and method.-The Board of Trade, Great Britain, issued in 1903 a report on wholesale and retail prices, in which index numbers were used to trace the prices of forty-five articles back to 1871. The articles were divided into four groups, namely, (1) coal and metals; (2) textiles (raw materials) ; (3) food and drink; and (4) miscellaneous. In the original calculation, the year 1871 was used as a base; in subsequent annual reviews the year 1900 has been taken.

In arriving at the number, the various commodities are weighted in accordance with the following method: in the case of raw materials derived almost entirely from foreign sources, (twenty-three in number of the forty-five), the general principle is to take the declared value of the imports in each case and substract therefrom the value of the raw exports. In the remaining articles, in which British production forms an important factor, various methods of calculation explained in the report are used, the results varying in accuracy, so that only a rough approximation is claimed for the weights obtained. The formula employed in arriving at the number is to multiply the price of each article in a given year by the standard weight, divide the product in each case \(b y\) the base price, add the several quotients, and divide the result by the sum of the standard weights.

Results.-The following table, issued in the Labour Gazette for January, 1910, shows the course of the number from 1871 to the present time:-

\hline
\end{tabular}

In the report published in 1903, the accompanying interesting chart, showing the course of prices in England throughout the nineteenth century, was issued. The chart is based on the index numbers of Jevons for 1801-1846, Sauerbeck for 1846-1871, and the Board of Trade for 1871-1900. All are of course reduced to a common base period, viz., 1871.
 JFVONS, SII RBBECK, AND TAL, BOARD (OH TRIDE..

\section*{Hamburg Prices.-Soetbeer's, Kral's and Conrad's Index Numbers.}

On the contiment of Europe, the most celebrated studies of prices have been those based on the extensire and trustrorthy data furnished by the Bureau of Commercial Statistics of Hamburg, Germany. The statistics relate to import prices, but are of exceptional value owing to the fact that, Hamburg being a free port, and declared values being based on ruling Hamburg prices, they show very accurately and with a wealth of detail the prices prevailing on the Hamburg Exchange. They cover over 300 articles and go back to the year 1847. Unfortunately for statistical purposes, the entry of Hamburg into the German customs union in 1888 greatly curtailed the range of this material, a record of the goods coming in by land being no longer kept. Efforts, however, have been made, not without success, to maintain the comparability of the later and earlier figures.

The best known index number founded on Hamburg prices is that of Dr. Adolf Soetbeer, published in 1886. It covers the period 1847-1885. The number includes the prices of 100 articles quoted from the publications of the Hamburg Bureau, to which are added a few important food prices obtained from the records of public institutions in Hamburg. Altogether Soetbeer's number covers 114 articles, divided into the following eight groups:-(1) Products of agriculture; (2) animal and fish products; (3) southern products; (4) tropical products (exclusive of cotton); (5) minerals and metals; (6) textile materials; (7) miscellaneous articles; and (8) British articles of export. Food products and raw materials bulk largely in the list. The base period is \(1847-50\), and the number is unweighted.

Notwithstanding the difficulty involved in the continuation of Soetbeer's tables, owing to the change of 1888 , Dr. Heinz, Director of the Bureau of Commercial Statistics of Hamburg, has extended the investigation as far as 1891. The following table shows the course of the number as thus extended from 1847:-

TABLE SHOWING THE COURSE OF PRICES AT HAMBURG, qERMANY, FROM 1851 TO 1891, BASED ON SOETBEER'S INDEX NUMBERS.
[Number of Articles-114.]
[Average Prices, \(1847-50=100\).]

The above statistics may be represented graphically as follows:-
CHART SHOWING COURSE OF PRICES AT HAMBURG, GERMANY, FROM 1851 TO 1891, BASED ON SOETBEER'S INDEX NUMBES.
[Number of Articles-114.]
[Average Price, \(1847-50=100\).

Dr. Heinz has also constructed an independent number on a different basis from that used by Soetbeer. This is now continued from year to year in the annual publications of the Hamburg Bureau.

Another notable analysis of the Hamburg prices is that of Dr. Franz Kral, whose primary objeot was to throw light on the monetary condition of the German Empire. His analysis embraces 265 articles for the period 1847-1884, the jear 1871 in which silver was demonetized in Germany being taken as the basis. Kral's grouping is different from, that of Soetbeer but no material change in results is shown.

The index number of Professor Conrad, of Halle, also based on Hamburg prices, covers forty-seven articles, the period 1847-18i0 being taken as a standard. Conrad's number rose to 106.1 during the period 1871-1850, but dropped again to 93.82 in 1881-1885; to 83.32 in 1886 ; to 81.1 S in 1887 ; to 77.85 in 1888 ; to 68.52 in 1896 and to 67.08 in 1897. In 1898 it had risen to 72.86 .

An earlier German economist, Drobisch, is cited by Fountain as furnishing the first example of a weighted index number. Drobisch published in 1871 an essay on methods of calculating changes in commodity prices and gold values. His proposal was to divide from year to year the total value of certain articles dealt with in a particular market by the total quantity of these articles and to compare results. The method is that of fluctuating weights in a simple form.*

\section*{Price Statistics Collected by European Governments.}

Statistics of prices over a more or less extended period have been collected by the governments of Germany, Austria, France and Italy.' The German govermment's statistics date from 1879, and cover thirty-seven articles, in thirty leading markets lhroughout the empire. The quotations are furnished by Chambers of Commerce or similar todics. In Austria, a volume issued in 1890 by the Finance Department, for

\footnotetext{
- Vor a review of the other German inrestigations of Laspeyres, Paascho and Van der Borght, see Laughlin's' Princijlet of Money;' p. 190 et seq.
}
the purpose of assisting in the study of the monetary question, contains price quotations for a limited number of articles in thirty-three localities, from 1830 to 1890. In France, comprehensive statistics relating to import and export prices are available. A permament commission of over 100 members, has jurisdiction in the determining of values, and the results are regarded as in every way authoritative. The Statistical Bureau of Italy published in 1886 a volume dealing with the prices of certain food products for the period 1862-1885. The Annuario Statistico Italiano, 1899. contains a comprehensive series of quotations for the years 1871-96.

Of all of these it may be stated that the general tendency shown in the course of prices does not differ materially from what has been illustrated in the foregoing charts and tables. \(\dagger\)

\section*{United States Index Numbers.-Index Number of Finance Committee of the United States Senate.}

History and method.-The United States Senate undertook in 1891, through its Committee of Finance, an extended investigation into the history of prices and wage: in the United States, with special reference to the effect of the tariff laws thereon. The investigation covered the period from 1840 to 1890 , and the result was one of the largest collections of statistics ever made under a uniform system. Two hundred and twenty-three series of quotations, including prices of manufactured articles as well as of raw materials, were presented in a continuous record back to 1860 ; while a record back to 1840 was completed for eighty-five articles. The general purpose of the committee was to ascertain 'through accurate and adequate statistics of prices the changes which have taken place in the condition, as shown by the relative purchasing power of their earnings, of the great mass of the people in the country for the half century which has just closed.' The committee did not attempt to point out the effect which legislation may have had from time to time in producing these changes, but limited its inquiry to the collection of facts with the greatest possible degree of accuracy.

The prices used were wholesale prices, taken either directly from the books of merchants and manufacturers or from trade journals.

The year 1860 was chosen as the base or standard year as representing a period in the industrial development of the United States midway between the methods of production prevailing before the civil war and those which came into use later, and as being a period of comparatively normal prices.

The commodities were divided into eight groups, namely:-(1) food; (2) cloths and clothing; (3) fuel and lighting; (4) metals and implements; (5) lumber and building material; (6) drugs and chemicals; (7) house furnishing goods, and (8) miscellaneous.

Three distinct index numbers were calculated by the committee for each year, two of them weighted and the third unweighted. In the determining of the weights for the former, occurs the first practical illustration met in the present review of the 'budget' method of fixing weights, of which an outline was given in passing above. Whatever its shortcomings as a system of weighting, the details in the present instance are of exceptional interest.

In the quest for the necessary basic information, the result of a previous investigation by the United States Department of Labour for the purpose of discovering the values of the more important articles consumed by what might be regarded as a

\footnotetext{
+ An abstract of the statistics gathered by the above mentioned European governments down to 1890 may be found in Professor Falkner's report contained in the report of the U. S. Committee of Finance on wholesale price and wages, 1892, pages 200-324.
}
typical family in the United States were made use of. In obtaining these results details had been collected as to the principal expenditures of 2,561 families, all of the working class. These had been subjected to analysis and a process of averaging with the following result:-

\section*{dISTRIBUTION OF EXPENDITURE FOR 2,561 NORNAL FAMIIIES.}
\begin{tabular}{|c|c|c|}
\hline & Group. & Per cent. of Expenditure for each purpose. \\
\hline Rent & & \(15 \cdot 06\) \\
\hline Fool & & 41.03 \\
\hline Fuel. & & \(5 \cdot 00\) \\
\hline Clothing & & \(15 \cdot 31\) \\
\hline Lighting & & \(\cdot 10\) \\
\hline All other purposes & & \(22 \cdot 70\) \\
\hline & & \(100 \cdot 0\) \\
\hline
\end{tabular}

As already explained, a result like the above is incapable of immediate application to a list of wholesale commodities. It was necessary, therefore, for the committee to secure more specific data as to the distribution of expenditure within the several groups. An additional investigation was accordingly undertaken by the committee itself into the budgets of 232 families. The statistics thus secured, showing the relative weight in consumption of each article contained in the family budgets, were appljed to the various articles in the index number, a method of grouping being resorted to where the articles were found not to have identical descriptions. The weights thus obtained were used for each year of the period, though based on the consumption of families in 1891.

The statement of the Department of Labour showing the distribution of expenditures, includes, it will be seen, under the items 'rent' and 'other purposes,' an important field of expenditure which was not covered by the Senate Committee's investigation. Herein arose the necessity for a double weighted number. The first number of the committee's report assumes that rentals and the commodities coming mittee's report. The first number assumes that rentals and the commodities coming under the heading of 'other purposes' remained unchanged throughout the period. The second leaves these features out of consideration altogether.

Results.-The following table shows the final results of the committee's investigation.
table of index numbers of the united states senate committee, 1840-1891.
\begin{tabular}{|c|c|c|c|}

The following chart shows the course of the unweighted mean from 1846 to 1890.

Chart Showing Course of Wholesale (Currency) Prices in the United States, 18401891, based on Falkner's Index Number.
[Number of Commodities-223.]
[Average Prices for \(1860=100\).] .

A convenient summary of the foregoing table by periods of five years is found in the following:-
table of lndex numbers of the united states senate committee by fine year perions, 1840-1891.
\begin{tabular}{|c|c|c|c|}
\hline Periods. & All articles simply a veraged. & All articles averaged according to importance, certain expenditures being considered uniform. & All articles a veraged according to im portance, comprising \(68 \cdot 60\) per cent of total expenditure. \\
\hline 1840-44 & 108.8 & \(93 \cdot 9\) & \(91 \cdot 0\) \\
\hline 1845-49 & \(103 \cdot 2\) & \(93 \cdot 3\) & \(90 \cdot 1\) \\
\hline 1850-54. & \(106 \cdot 6\) & \(99 \cdot 4\) & \(99 \cdot 4\) \\
\hline 1855-59. & \(108 \cdot 2\) & \(107 \cdot 1\) & \(110 \cdot 3\) \\
\hline \(1860-64\).
\(1865-69\) & 131.5
178.8 & 114.0 & 120.5 \\
\hline 1870-74. & 137.5 & 123.6 & \(134 \cdot 4\) \\
\hline 1875-79. & 110.9 & \(108 \cdot 9\) & \(112 \cdot 9\) \\
\hline 1850-84. & \(105 \cdot 3\) & \(104 \cdot 4\) & \(106 \cdot 3\) \\
\hline 1855-85. & \(93 \cdot 2\) & 96.7 & \(95 \cdot 2\) \\
\hline 1890-91. & \(92 \cdot 3\) & 96.0 & \(94 \cdot 1\) \\
\hline
\end{tabular}

The influence of currency depreciation is held accountable in a large measure for the inflation of prices between 1861-68. In order to eliminate this disturbing factor the above table has been reduced to a gold basis as follows:-

Table of index numbers of united states senate committee, on gold basis, by fiveyear periods, 1840-1891.
\begin{tabular}{|c|c|c|c|}
\hline Periods, & All articles simply averaged. & All articles averaged according to importance, certain considered uniform. & All articles averaged according to impor tance, comprising total expenditure. \\
\hline 1810-44 & \(108 \cdot 8\) & 93.9 & \(91 \cdot 0\) \\
\hline 184549. & 103.2 & \(93 \cdot 3\) & \(90 \cdot 1\) \\
\hline 1850-54. & 106.6
108.2 & 99.4
107.1 & \({ }^{99 \cdot 1}\) \\
\hline 1860-64. & \(108 \cdot 1\) & \(105 \cdot 3\) & \({ }_{99} 10\) \\
\hline 1865-69 & \(118 \cdot 7\) & \(103 \cdot 9\) & \(120 \cdot 5\) \\
\hline 1880-74.. & \({ }_{103}^{121 \cdot 8}\) & 109.4
102.0 & \({ }_{105}^{118.9}\) \\
\hline 1880-84. & \({ }_{105}^{103}\). \({ }^{\text {a }}\) & 104.4 & \({ }_{106} 10 \cdot 3\) \\
\hline 1885-89.., & \({ }_{93.2}\) & 96.7 & \(95 \cdot 2\) \\
\hline 1890-91. & \(92 \cdot 3\) & 96.0 & \({ }_{94} \cdot 1\) \\
\hline
\end{tabular}

It will be seen from the foregoing that measured in currency the highest range in prices is found in the period between 1865-1869, but that measured in gold the maximum is found in the succeeding period of five years. Another noticeable feature is that in 1890 and 1891 prices were shown to be lower in the United States than at any other time since 1850.

The following interesting analysis of the prices of American agricultural products treated separately is given. The table covers the fifteen staple products of American agriculture, namely, barley, clover seed, corn, cotton, flax seed, hemp, hides, beeves, hogs, sheep, oats, rye, timothy, tobacco and wheat.
table of relative prices of agricultural products, w gold, 1860-1891.
\begin{tabular}{|c|c|c|c|}
\hline & Ytar. & Simple average of 15 products (from Table 33.) & Weighted average of 9 products (from Table 35. ) \\

\hline 1888 & & \(94 \cdot 9\)
95 & 89.6 \\
\hline 1889. & & \(91 \cdot 3\) & 86.5 \\
\hline 1890. & & 97.4 & 93.7 \\
\hline 1891 & & \(97 \cdot 1\) & 98.4 \\
\hline
\end{tabular}

In the matter of wages, the investigation showed that the general level was approximately 60 per cent higher in 1891 than in 1860 and approximately 75 per cent higher than in 1840. With regard to hours, on the average the eleven hour day of 1860 was found to have given place to the ten hour day in 1891.

In the year 1900, Professor Falkner, the statistician of the committee, issued a continuation of the above report, which brought its results to the middle of 1899. The base period, in this supplementary investigation, was changed to 1590-1592, and the simple average method of weighting was modified to the extent of combining the similar articles to form one index number in calculating the numbers for the several groups and in calculating the final number for all commodities. The number thus derived showed a slight rise, namely, 102 to 103.1, between January, 1590, and October, 1890 ; thereafter there was an almost continuous decline to 79.9 in July, 189\%, after which the number rose to 86.5 in January, 1899, and to 92.9 in July, 1899.

\section*{Index Number of the United States Department of Commerce and Labour.}

History and method.-Ten years subsequently to the exhaustive investigation of the Senate Committee, outlined above, the United States Department of Commerce and Labour, which had assisted materially in the collection of the data for the committee, set on foot a somewhat similar inquiry into the course of prices from 1890 to 1901 . The investigation has been repeated from year to year since, and has had the practical result of bringing the Finance Committee's results up to the present, though no attempt to collate findings has been made. In a number of instances it was found impossible to secure quotations for commodities included in the report of the committee, many articles which were covered in the carlier inguiry having ceased to be important factors in the market, and others having disappeared entirely from
production. On the other hand, several articles not traced in the earlier report were found to have become of sufficient importance as to render necessary their inclusion in any study of later prices.

Altogether 250 series of quotations were obtained for the entire period covered and an additional eleven for some portion of the period. The commodities were divided into nine groups as follows:-

Group.

> Number of Commodities Quoted.

Farm produce. . . . . . . . . . . . . . . . . . . . . . . . . . . . . 16
Foods 54
Cloths and clothing. . . . . . . . . . . . . . . . . . . . . . . . . . . . 76
Fuel and lighting. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 13
Metals and implements. . . . . . . . . . . . . . . . . . . . . . . . 39
Lumber and building material.. .. . . . . . . . . .. . . .. .. 27
Drugs and chemicals. . . . . . . . . . . . . . . . . . . . . . . . . . 9
House furnishing goods. . . . . . . . . . . . . . . . .. . . . . . . 14
Miscellaneous. . . . . . . . . . . . . . . . . . . . . . . . . . . . .. 13
The index number is unweighted, the simple average of the relative prices being taken to show the general level.

Results.-A summary of the index numbers obtained, arranged according to the groups above mentioned, is as follows:-
table of index numbers of the united states department of labour, 1890 to 1908, by Groups of commodities.
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Year. & Farm Products. & Food, \&c. & Cloths and Clothing. & Fuel and Lighting. & Metals and Implements. & \[

\end{tabular}

The following chart shows the course of all commodities in the United States, according to the latest return of this investigation, from 1890 to 1908:-

CHART SHOWLKG COURSE OF PRICES IN THE UNITED STATES, BASED ON THE INDEK NUMBERS OF THE UNITED STATES DEPARTMENTS OF LABOUR, 1890 TO \(190 S\).
[Number of Commodities-261.]
[Average price for 1890 to \(1899=100\).]

The returns are further analysed according as they relate of raw materials or manufactured articles as on the following page.

CHART SHOWING COURSE OF PRICES OF RAW AND MANUFACTURED COMMODITIES IN THE UNITED STATES, BASED ON THE INDEX SUMBERS OF THE UUNTED STATES DEPARTMGNT of LABOUR, 1890 то 1908.
[Average Price for 1890 to \(1890=100\).]

\section*{Retail Prices in the United States.}

As supplementary to the investigation above-mentioned by the United States Department of Commerce and Labour into the actual living expenses of normal families, a valuable collection of statistics was made in 1903 relating to retail prices. The statistics, as in the case of wholesale prices, covered the period 1890-1902. They have been similarly continued from year to year since. Some thirty articles, all being foodstuffs, are included. In the first instance the information was collected from over eight hundred retail merchants in sixty-eight localities scattered over thirty-three states of the union. Altogether over 5,300 schedules or statements of prices were secured. These were reduced to a system of index numbers, two numbers being calculated, one a simple average and the other weighted in accordance with the relative importance of the commodities as shown by the previous investigation into actual expenditures. The two results show very little difference, the unweighted mean for 1907, the latest year for which returns are available, being \(120: 7\) and the weighted mean being 120:6. The method of applying the weights is illustrated in the following table, which will also serve to show the articles covered and the price-level attained by each in 1907:-

Table Illustrating the Method of Computing the Relative Retail Price of Food in the United States in 1907, the Various Articles being Weighted According to Average Consumption in 2,567 Workingmen's Families.
\begin{tabular}{|c|c|c|c|}
\hline Article. & Relative Importance. & Relative. Price. & Result. \\
\hline Fresh beef. & 1,531 & \(119 \cdot 9\) & 183,566.9 \\
\hline Salt beef. & 161 & \(114 \cdot 1\) & 18,370 1 \\
\hline Fresh hog products. & 429 & \(142 \cdot 5\) & \(61,132 \cdot 5\) \\
\hline Salt hog products & 425. & \(143 \cdot 1\) & 60,817.5 \\
\hline Other meat. & 299 & \(127 \cdot 6\) & 38,152 4 \\

\end{tabular}

In the following chart the dotted line illustrates the course of retail prices in the United States as shown by the department's investigation. For comparative purposes a line showing the course of the wholesale prices of the same commodities is inserted:

CHART SHOWLIG COURSE OF WHOLESALE AND RETAIL PRICES OF FOOD IN THE UNITED STATES, SIMPLE averages, 1890 to \(190 \%\).
[Number of Articles-S0.]
- [Average Price for 1890 to \(1899=100\).

From this chart it is apparent that both wholesale and retail prices of food in the United States were higher in 1891 than in 1890, the wholesale, however, showing a much greater advance; both wholesale and retail prices were lower in 1892 than in 1891, the decline being much grenter in wholesnle than in retail; both were higher in 1893 than in 1892; both lower in 1894 than in 1893; both lower in 1595 than in 1894: both lower in 1896 than in \(\mathbf{1 8 9 5}\), the decline in wholesale being much greater than in retail; both were higher in each of the years from 1897 to 1902 than in the year im: mediately preceding; wholesnle prices were lower in 1903 than in 1802, while retail prices remained on the same level; wholesale prices were slightly higher in 1904 than in 1903, while retail prices made a more marked advance; both wholesale and retail prices were higher in 1905 than in 1904, both higher in 1906 than in 1905, and both higher in 1907 than in 1906.

\section*{Dun's Index Number.}

History and method.-The mercantile agency of R. G: Dun and Company, New Yo:k, issued in January, 1901, a series of index numbers extending back to 1860. which have been continued monthly up to \(190 \%\). The commodities quoted number 350, divided into seren groups, namely, (1) breadstuff; (2) meats; (3) dairy and garden products; (4) other food; (5) clothing; (6) metals, and (7) miscellaneous articles. The wholesale price of each article on the opening day of each month is made the basis of the calculation. The method of calculation is of a novel character. At the outset, the object of the number is defined as to show 'the cost of a year's supplies of all the necessaries of life for a single individual.' The index number in the case of each article and group is the actual amount in dollars and cents required to purchase a yearly supply or budget at the date named. No further explanation of the list of articles included in the number is given than the following statement published in Dun's Review of September 7. 1901:-

Breadstuffs include many quotations of wheat, corn, oats, rye and barley, besides beans and peas; meats include live hogs, beef, sheep and many provisions, lard, tallow, \&c.; dairy and garden products include eggs, vegetables and fruits: other foods include fish, liquors, condiments, sugar, rice, tobacco, \&c.; clothing includes the raw material of each industry, and many quotations of woolen, .cotton, silk and rubber goods, as well as hides, leather, boots and shoes; metals include various quotations of pig-iron, and partially manufactured and finished products, as well as minor metals, coal and petroleum. The miscellaneous class embraces many grades of hard and soft lumber, lath, brick, lime, glass, glassware. turpentine, hemp, linseed oil, paints, fertilizers and drugs.

With regard to the method of calculation the following statement is made:-
After selecting a list of articles covering all the necessaries of life, including whisky, beer and tobacco, each quotation is multiplied by the quantity annually consumed by each inhabitant, as nearly as may be ascertained hy statistical records. While these figures cannot be considered exact, the approximation is sufficiently close to attain the desired result, and the ratio being constant the comparison with different dates shows to a cent the rise or fall in cost of living. In many cases a large number of quotations are averaged in order to secure a representative price for the commodity, thus avoiding the special effect on one particular grade of exceptional conditions. Both rav materials and manufactured products are included, preventing the excessive influence of speculative operations in the former, since markets for finished products are more stable. In these cases the per capita consumption is so proportioned as to avoid duplication.

Using quantities representing the per capita consumption gives each commodity its proper value. It would obviously be useless to take an equal quantity of each article, since a sharp rise or fall in the price of something little used might more than balance the change in a commodity of large daily requirement. Hence, this proportional distribution makes the index number show clearly the cost of living at rarious dates by giving due regard to the relative importance of each article. No luxuries are included beyond silk and tobacco, which are of such general consumption as to be practically essential to a faithful record.

\end{tabular}

Bradstreet's Index Number.
History and method.-Bradstreet's index number, which dates from January 1. 1892, and is based on quotations for 107 commodities divided into thirteen groups, is calculated on the following system of weighting. The index taken for each article
is the cost of one pound weight of the commodity at the date named. The average price per pound of the items in each group forms the index number of the group and the sum of the thirteen group indices is the final index number. The defect of this method is that it gives an overwhelming importance to the fluctuations of the higher priced commodities, an importance which is scarcely overcome by the inclusion of a larger number of the inferior and cheaper articles. A variation of a few cents per pound in the price of silver is of very minor importance compared with a similar rariation per pound in iron. In like manner, under the heading of textiles the variations of silk tend to overwhelm the variations of wool, jute and flax. The number, nevertheless, corresponds in the main with the other American numbers of the past twenty years.

Results.-A complete table of Bradstreet's index number from 1892 up to the beginning of the present year is as follows:-

BRADSTREET'S APPROXIMATE PRICE INDEX NUMBERS.

The groups that make up the index number are set out in the following table:-
\begin{tabular}{ll|l|l|l|l|l|l|l|l}
\hline \hline
\end{tabular}

The latest number of Bradstreet, that for January, 1910, it will be seen, establisles a new high record surpassing the previous high record of March, 1907, by 1.1 per cent, and surpassing that of January 1, 1909, by over 11 per cent. The Economist number during the same period showed an adrance of 9 per cent. Compared with the comparatively low point of June, 1908, an increase of nearly 20 per cent is shown. The lowest point for cammodity prices shown by the number is July 1, 1896, compared with which the latest figures reveal a gain of more than 61 per cent. Commenting on this, Bradstreet's Journal remarks:- Standards of living with a variety of other conditions have changed since those days of economic inertia when the price situation was not only profitless but ruinous as well.'

\section*{III. CAUSES AND EFFECTS OF VARIATIONS IN PRICES.}

With the increasing use of index numbers during the past few years the statement is frequently met, that such and such an index number indicates the change in cost of living, the effect of such and such a cause, \&c. Enough has been said in the foregoing, in pointing out the difficulties of calculating an index number and the imperfections that must result, to demonstrate the need of caution in accepting, in matters of detail, the results shown by the most carefully constructed number, however confidently its general finding may be received. The fact that several of the most authoritative numbers differ in detail while agreeing in the main, is in itself sufficient to eonfirm this. In brief, the accuracy of an index number is a matter simply of the general law of probability. The whole, therefore, is more to be relied upon than the part. It is the part, however, that is usually called into requisition for specific deductions of the kind referred to.

These deductions will, for the most part, take two directions: first, as to the causes of the changes shown, and, second, as to the effect of the changes on the community at large, or on different classes, or on individuals. When it is possible to say that prices have risen or fallen, that goods are dearer or cheaper, it seems easy to add that the rise or fall was due to certain contemporary circumstances, such as the monopolistic control of industry, a decline in productivity, a variation in the supply of the nrecious metals, \&c., or that certain persons or classes are better or worse off than before. This, however, as already said, is to overlook the fact that a process which may te sufficiently comprehensive to measure general changes scientifically may not he of a kind to uncover the more particular points involved in the discovery of causes and consequences.

In the following statement a brief analysis is given of the general problem of the investigation of the causes and effects of price changes, with special reference to the upward movement during the past twelve years.

\section*{(A.) Causes of Recent Variations in Prices.}

The primary object of the present inquiry has been throughout to afford an accurate and comprehensive view of the movement of prices in Canada during the past two decades. No attempt has been made to deal with causes, except incidentally. in referring to important temporary fluctuations of particular commodities arising out of obvious or special circumstances. For example, an advance in brooms which took place during the autumn of 1909 is mentioned as a result of the exceptionally high price of broom corn, due in turn to crop failure; similarly, it is pointed out, a sharp decline in the price of silver-plated ware in 1907 occurred simultaneously with the equipment of a large establishment for the manufacture of this class of gonds in Canada; while a reference is made, in a general way, under the heading of lumber, to a number of circumstances which have accompanied, and have been suggested as explaining, the recent pronounced rise in that commodity. To go further than this, in a report like the present, would be to trench on ground which another and quite different kind of investigation is required to opon up, namely, an inquiry into recent industrial, commercial and financial conditions and methods in the light of the economic theory of prices.

The striking nature, howerer, of the circumstances prompting the inveatigntion. and of the results now shown, namely, a rise of considerably over one-third in the general level of prices within the past tvelse years-a rise which is still in progreas-has directed very wide-spread attention to the question of what are the causes of a phennmenon which implies so many scrious consequences to the community. It may be well, therefore, in concluding, to point to some of the leading agencies which mhy
produce a rise or fall in prices; which have probably been operative either separately or in combination to a greater or lesser degree in bringing about the present situation, and which should be taken into account by any one seeking an explanation of the changes illustrated in the accompanying tables and charts-whether they be changes temporarily in the price of a particular commodity, and thus comparatively easy of solution, or changes in the general price level, extending over a period of years, persisting through and in spite of temporary fluctuatious, and involving considerations perhaps as wide as the organization of society itself. Taking the last sixty years, as portrayed by the index numbers previously cited, such a general movement (upward) prevailed from 1848 to 1873 ; such a general movement (downward) from 1873 to 1597: and such a general movement (again upward) from 1897 to the present time.

In discussing the causes of price movements it is necessary to differentiate between causes primarily affecting the commodities themselves and causes primarily affecting money. The price of an article is the amount of the monetary standard for which it may be exchanged. It is apparent we have here two distinct sets of phenomena, in the meeting of which the relationship denoted by price arises. No review of possible causes of change is complete that does not take into account both sides of the question.

\section*{I. Causes Primarily Affecting Commodities.}

Dealing first with conditions arising in connection with the commodities themseives, the price of an article at a particular time and place may be said for the present purpose to be determined by the law of supply and demand, being fixed at the point where supply and demand are in equilibrium. When the demand for an article is great and the supply limited, the price ordinarily will tend to rise, and vice versa. It may be convenient, therefore, in searching for the causes of a given price variation, to approach the question from two points of view, namely, (1) the point of view of supply, and (2) the point of view of demand.

This is not, of course, to say that the two viewpoints involve distinct sets of phenomena. The same agency may, and very frequently does, affect both supply and demand simultaneously and in opposite directions. It is, in fact, almost impossible to mention any factor as determining a price that may not prove in the ultimate analysis to work through both channels and often in both ways, or that is sufficiently untrammelled in its working either way to permit of an exact estimate of its influence. The difficulty of isolating phenomena is here, as in every branch of social science, the first and perhaps the greatest.

That this is true in the case of prices is largely due to the action of the law of substitution. By this law a constant levelling up process is going on between prices of different commodities, as when a rise in the price of linens tends to check the consumption of these goods and thus decrease the upward price tendency, while at the same time increasing the demand, say, for cottons, and thus inducing cotton prices to follow in the wake of linens; or when a fall in the price of beef deflects the consumption of mutton and pork, and tends simultaneously to cause mutton and pork prices to decline and beef prices to stop falling.

It still remains convenient, however, to classify roughly the causes of price fluctuations according as their most immediate and obvious action is upon supply or demand.
1. As causes affecting in their immediate or most natural application the supply of an article, and thereby its price, the following may be mentioned:-
(a) Variations in yields or harvests.-By increasing or diminishing the supply of a commodity, variations in yields or harvest tend to raise or lower the price. Many instances of this will be found in the tables, as for example in the fall every fourth year in the price of canned salmon, the rapid fluctuations in fruit prices, \&c. But this obvious rule will be found in practice to require almost constant qualification. Under modern conditions, prices of the more important commodities tend more and more to be fixed in world markets. A local variation in harvest may, therefore,
operate chiefly, not through the agency of supply, but through that of demand, owing to its effect on the purchasing power of those members of the community who are engaged in producing the article in question. This will be especially pronounced where the product is a world staple and where the producers form a numervus class. Thus, a failure of the grain crop of Western Canada tends, in so far as the world market is affected, to enhance grain prices; but its more usual effect on Canadian prices is to lower them to meet the diminished purchasing power of a most important body of Canadian consumers. This lowering tendency, having begun with general articles of consumption, may extend, by the law of substitution, so as to include the grain itself in which the crop failure occurred.

Under this heading, changes in yields or harvests due to other than temporary or climatic causes should be taken into account. Two widely discussed problems of the present emerge here as having a bearing on prices, namely: the possibility of the exhaustion of the soil, forests, mines, \&c., now definitely under consideration by the government; and the persistent movement of the people into the cities, where, though they may continue to produce, the product is to a less degree the primary necessaries The rural population of Ontario decreased from 1,108,874 in 1899 to \(1,047,016\) in 1909, while during the same period the population of the cities increasel from 901,874 to \(1,197,274\). These are most importnnt subjects for examination in the present connection. The laws of diminishing and increasing returns as applied to agriculture and manufacturing, respectively, must be borne in mind throughout. Questions of this nature, however, merge gradually with the factor which is mentioned in the next following paragraph.
(b) Improvements or other changes in methods of production or transportation.That there has been a shortening of hours and a decline in the return from labour, together with a tendency towards wasteful and unscieatifis methols of prolustion generally has been asserted. The effect would be to enhance prices. On the other hand, an improvement in the production or distribution process tonds, other thing \({ }^{3}\) being equal, to lower prices. Coal oil is cheaper to-day than some years ago in part because of improvements in the methods and conditions of manufacture and sale. There has been for years past a constant decrease in the costs of transportation. One notable improvement which has occurred recently is in the transporting and storing of perishable food products. But as illustrating the interplay of the factors which determine prices the cold storage system is one of the agencies most frequently accused of late of being responsible for the rise in meats, eggs, \&c. It is declared that the enlargement of the facilities for storing, transporting and selling these products has been misused by the warehousement, on the one hand to compel the grower to regulate production, and on the other hand to maintain artificial market rates to the consumer based on the restriction and the non-perishable quality of the visible supply. \& The decline of the neighbourhood farmer, i.e., the disappearance of a class of agriculturists living near large cities and supplying families direct with butter, eggs, \&c., is directly attributable to the use of the refrigerator car.

\footnotetext{
§ The Committee of the United States Senate appointed ill February, 1910, to inquire into the high cost of living. reported on April \(\overline{7}\), that a limit should be put on the use of cold storage for the purpose of maintaining or advancing prices artificially. A Bill to meet thin recommendation was introduced into the Senate forthwith. In presenting the Bill, Semator Lorlge made the following statement:-
- Under the resolution of the Senate the select comittee appointed to inquire into wagen and prices of commodities was given authority to make recommendations. In pursuance of that authority the committee now desires to recommend to the Senate legislation limiting the time during which perishable articles of food may be held in cold storage. From such investigation as the committeo has thus far been able to make, they are satisfiod that some limit ought to be put on the use of cold storage for the purpose of mainfaining or advancing prices artificially. They are of the opinion that this limit of time will tend to an equalization of prices, and, in some cases to a reduction.
- The investigation of this subject now being made by the Agricultural Department is not completed, but it has proceeded far enough to confirm. by the rewults thus far obtained. the view taken by the committee. The question of the public health is not within the jurisdiction of your committee charged with the investigation into wages and prices. The
}
(c) The operation of trusts, combines, trade agreements among middlemen, dec. -The aspect of the cold storage problem, just mentioned, overlaps under this heading, just as an important phase of the operations of combines falls back under the preceding. A monopoly or combine may effect large economies in production (as a factor under (b) above), and thus produce a downward influence on prices. This advantage, however, is likely to be offset and a contrary disadvantage to the consumer produced by the increased control of supplies which such a combination is able to obtain, and the power of interference it is able to exert on the natural law of supply and demand. The number of these organizations of capital has been greatly multiplied of late and the fact is important to bear in mind in any inquiry into causes affecting present prices. Numerous instances of the influence of trade competition on prices have already been cited, as in the case of vinegar, table knives, \&c. Akin to the trusts are the various agreements among middlemen, by which trade customs may be fixed, with important results on prices. O.13 of tha most diffivult points to determine in connection with the recent rise in meat prices has been the respective profits of the producer. the transportation agent, the commission merchant, the jobber and the retailer. It is pointed out that several Canadian products are cheaper in the British than in the Canadian market. Manipulation of markets by speculators may also be mentioned under this heading.*
(d) Legislative enactments may have an important bearing on prices. The effect of a tariff increase is to limit the source of supply, and thus diminish competition. If it establishes an industry in the country it may simultaneously increase general consumption. Bounties and excise duties also have an immediate effect on prices; examples have already been cited. In a narrower field, local market by-laws and regulations have a like effect. The increasing cost of government, state or municipal, by increasing taxation has advanced the rate of merchants' profits.

Throughout any investigation as to the effect of supply prices it should be rememhered that supply does not necessarily act proportionately. A ten per cent increase in the supply of an article might be readily absorbed, whereas a further increase of two per cent might cause the market to break violently.
2. Coming to the standpoint of causes primarily affecting demand, and thereby operating to enhance or decrease prices: Some of the more common of these are as follows:-
(a) Seasonal causes, as for poultry at Christmas. These, however, act potently through supply, especially in the case of commodities for which the demand is more or less constant.
(b) Changes in custom or fashion, temporary or otherwise, as in the substitution of evaporated for dried apples, the increased consumption of canned salmon following the publication of reports of improper methods of meat packing at Chicago, \&c. A thorough knowledge of conditions governing the trade in any product is essential before the cause of price variations can be pronounced upon.
(c) Increase in population, industrial expansion, \&c., involving deferred productivity.. Under this heading falls to be considered a feature of the present situation which has been declared to lie at the very basis of the high prices prevailing. The past decade has been one of exceptionally rapid industrial expansion in Canada. Immigration has been on an unprecedented scale. Large areas of new lands have been brought under cultivation. Accompanying this has been a heavy expenditure, chiefly of borrowed capital, on railways, towns, public works

\footnotetext{
committee have no doubt, however, that a limitation of the time during which perishable articles of food, and more especially meat products, may be retained in cold storage would be hygienically of very great value, and would tend to check many physical troubles which are thought by those who have examined the question to be attributable to the practice of keeping meats particularly in storage for a very long time.
'The committee, therefore, recommends legislation in this direction by Congress at the earliest possible moment.'
*See the article 'Artificial Dearness' in Palgrave's Dictionary of Political Economy.
}
and other large undertakings. The point emphasised in this connection is that many of these enterprises have not yet become productive. Hence the weight thus far has been thrown almost entirely into the demand side of the scale. The demand has been in the first instance for the materials consumed in the actual undertakings; but the circle of industrial and trade activity, once set in motion, has gone on widening until it has reached all but the uttermost edge of the community. In the tables it will be seen that heavy increases have taken place in lines brought primarily under the influence of the expansion, such as lumber, food supplies, and articles produced by the labour deflected, whereas goods of distant growth and manufacture appear in many cases less affected, other things being equal. In the general result, wages and prices have been following each other for some time past in what has been described as 'an ascending spiral.' The shortening of hours and the slackening of effort mentioned above are perhaps best considered as a parallel phenomenon with the rise of wages. So likewise is the fact that with greater spending power, has come a general rise in the standard of living. Wastefulness and extravagence may have supervened, having their root in the distribution of so much accumulated wealth. A standard of this kind once established is very difficult to dislodge. 'The luxury or to-day' says John Stuart Mill, 'is the necessity of to-morrow.' This point of view in its present application has been summed up in the remark that the problem to-day is not one of the high cost of living, but one of the cost of high living. But the situation is wider than any merely personal issue, and its solution depends to a degree on the transition from potential to actual productiveness of the buildings, railways and towns now under construction, whereby what have hitherto been rery potent factors in demand will become factors also in supply.

In assigning weight to the above as a cause of present high prices, the extent to which similar conditions have prevailed outside of Canada is to be taken into account. Industrial expansion in the United States has been on lines parallel on the whole to developments in Canada. Important also to consider in this connection is the effect of the heary expenditure on armaments in the leading countries of Europe. These expenditures are for a purpose that is essentially nonproductive, for even if they be charged in any one country against the safety of commerce, from a world-market standpoint they constitute a loss. When turned to destructive uses as in the two great wars which the past decade has witnessed, the South African war and the Russo-Japanese war, the evil is, of course, greatly accentuated. The enormous destruction of property thereby entailed must necessarily have been attended with important results on the general level of prices.

\section*{Causes Primarily Affecting Money.}

Apart from the above agencies which act and react upon prices through the ordinary channels of supply and demand, consideration must be had of various influences which group themselves about the monetary and financial systems.§ Without

\footnotetext{
§ The following passage from Bowley's 'Elements of Statistics, p. 219, is of intereat here as defining the limitations of index numbers in throwing light on this side of the question of prices:-
- It has sometimes been supposed that we can estimate the effects of general causes directly; that we can, for instance, obtain an oljjective measurement of the change in the purchasing power of gold, by evaluating it at two dates in terms of all commodities pur: chased. Weighted by the amount spent on each; but it is better to neglect this method at once both as impracticable and as not answering the purpose of index numbers, for the effects of minor causes affecting separate commodities would not then be necessarily separated from the main cause.
- Suppose that the changes in a group of quantities are determined br one general force which acts on all in the same sense, that is, tends to increase all or decrease all, and by several other forces each of which acts on one or more of the quantitiea, and some of which tend to increase, others to decrease the quantities thes aflect then of the special forces, some will tend to increase, others to diminish the average, while the general force will have a cumulative effect entirely towards increasing, not entirely towards diminishing it. If the separate effects of the special forces are small compared with their number, they will tend to naturalize one another in their influnce on the average; and the change in the arerage will show the influence of the general cause only.'
}
expressing any view on so frequently debated a subject as the so-called 'quantity theory' of money (except to say in passing that in no case is it to be regarded as capable of simple application) it may be pointed out that the gold supply of the world has within recent years received a heary accretion. According to estimates of the United States Mint, the gold production, which in 1895 was approximately \(\$ 199,301\),000 , rose steadily to over \(\$ 300,000,000\) in 1899 , and to approximately \(\$ 100,000,000\) in 1906. It has continued to increase since, reaching \(\$ 435,000,000\) in 1908. But several equally important considerations must be dealt with in collaboration with these returns. The gold side of the problem, like the commodity side, is of two aspects,supply and demand. In the first place, the annual supply of gold as estimated above, must be considered relatively to the total stock-gold not being subject to destruction like most other commodities, except to the insignificant extent represented in losses and abrasion. This at once reduces materially the significnce of any increase or decrease in annual output. On the side of demand, likewise, careful investigation must be made to see if any offset to the increase in supply may not have occurred. The possible increased use of the precious metal in the arts and in hoarding as well as for currency must be borne in mind. There is the fact also that Japan, Mexico and several South American States have adopted the gold standard during the past fifteen years, thus creating a new demand for the metal. Again, has the increase in the gold supply been greater proportionately than the increase in the commerce of the world has required? And has the rapidity of circulation been unchanged in the past decade? In any event, the part which gold plays as a direct vehicle of exchange dwindles into insignificance beside that of the credit system which, though resting on a metallic basis, is not necessarily proportioned to metallic reserve, and the organization of which is therefore a most important factor in the modern financial world. The whole level of prices is swayed at intervals according to the confidence or timidity of purchasers and investors. That the organization of this system has been increased and perfected of late there would seem evidence to believe. The rapid recovery from the panic of 1907 is by many attributed to the increased confidence which increased organization has been able to produce. But to appraise thiz accurately would require an investigation of the entire financial system.

The above will be sufficient to show the complexity as well as the manysidedness of the problem of price variations and will have indicated at least the more important supplementary information required in approaching, from the standpoint of cause, the data regarding changes herein supplied.

\section*{(B) -Effects of Variations in Prices.}

Much of the foregoing applies with equal force when the endeavour is to ascertain the effect or effects, instead of the cause or causes, of a change in general prices. The questions are, of course, distinct; but the factor which mainly obscures generalization in the one case as in the other is the complexity of social phenomena. It will be of interest, however, to outline, from the point of view of effects, as from the point of view of causes above, the limitations which necessarily attach to an inquiry like the present. This is perhaps the aspect of the entire problem which possesses the chief human interest.

The concrete question is: Prices having risen approximately one-third in the past twelve years, what is the meaning of the change to the individual and the community?

\footnotetext{
* Dr. Soetbeer's calculation of the proportion of gold consumed in the arts remains the most frequently cited. He estimated that in 1886 of a total production of gold of about \(£ 20,000,000\), more than \(£ 12,000,000\) were thus used. Professor Alfred Marshall writing in the Contemporary Review for March, 1887, says: 'The consumption of gold for purposes of the arts and for hoarding is increasing at an unprecedented rate. In the west, gold watch chains are succeeding silver watch chains, and in the east gold bangles are succeeding silver bangles. The causes of this increase are likely to continue, because they are based on the modsrn tendency to the accumulation and deffusion of wealth; which themselves are sure to continue in spite of the occasional retrogression caused by great wars, because they are founded on that progress and diffusion of knowledge which cannot go backwards.'
}

In dealing with the effects of a change in price, it is necessary to approach the question from two standpoints: (1) the standpoint of the producer, and (2) the standpoint of the consumer.
1. The producer's interest in prices is obvious. The present inquiry shows for a large number of commodities what the course of the producer's selling prices has been for twenty years past. What the producer's profits have been, is, of course, not touched upon.
2. Consideration of the consumer's standpoint opens up the cost of living aspect of the result. Prices having advanced one-third, it might seem possible to assume at once that from the consumer's standpoint living expenses have increased to a corresponding degree. But before accepting that view as final it is necessary to point to certain circumstances which should be given an influence.
(1) In the first place, it is necessary to recall the observations made with regard to the manner in which wholesale prices reflect the cost of living. Retail and not wholesale prices represent the actual cost of goods to the consumer, and retail prices in many respects are under a different law from wholesale. They involve considerations that are not present at all in wholesale prices, those grouped about the methods of the ultimate middleman. They are slower in their movement, and it is possible. also, that they may be in an opposite direction, though not for long at a time, unless under exceptional circumstances. In the present case, and speaking for the period as a whole, it may be regarded as probable that the general course of retail prices has been approximately that of wholesale. To render this absolutely certain, however. would involve an inquiry in detail into the methods of retailing prevalent throughout the country, localities within short distances of each other often differing considerably: in trading customs and in the standard of retailers' profits.

A more important consideration, in the present connection, is the fact that rentals are not represented in an index number of wholesale prices. In the average family, rent is one of the most important items of expenditure. In a wholesale index number it can only be reflected in so far as the price of lumber and building material may be said to govern dwelling house rentals. Land values do not appear, nor is there any light thrown on the question of locality, style of dwelling, \&c., which make the study of comparative rentals so difficult. The difference between the variations in the price of building materials and the course of rentals might possibly be great, especially in localities where growth has been rapid and where land values have been correspondingly buoyant.
(2) Even with statistics as comprehensive and as accurate as could be desirel it remains that the individual is a law to himself and that no pronouncement based on averages can apply individually except by accident. One man eats meat twice daily, another only thrice in the week; one consumes tobacco and alcohol, another abstains from both. Again, the law of substitution is in ceaseless operation; a series of important price changes may result in an almost complete change in the consuming habits of an individual or family, though this is modified by the fact that prices of related articles move, by the same law, together. These considerations have less force as the scope of the inquiry is broadeued from individuals to classes, though between class and class much of the same difference applies as between individuals nnd individuals. The budget method may here come into use. Different budgets will be necessary for different classes. Accordingly, when a generalization for the whole community is desired, the difficulty of applying the budget method becomes very great. The best that statisticians have accomplished is a budget of some class with a fairly uniform consumption standard, for example, the working class. It may be noted, in the present case, that many of the most important staples of consumption have been among the commodities which have shown the most rapid rate of increase. It may be inferred, therefore, that consumers generally have borne the full brunt of the change that is indiented. From this riewpoint, the weighted mean shown in the introduction offers perhaps the best approximation.
(3) A change in prices affects the well-being of the consumer only where no corresponding change in income has occurred. If it can be shown that wages and salaries have kept eren pace with the recent rise in prices, then the latter has necessitated no change in habits or real cost of living. This is a feature which the individual will be able to answer in the present case for himself. The question of a change in wages has two aspects: to the employer a rise or fall in wages means an increase or decrease in the expenses of production; to the great majority, however, wages or salaries are representative of income, except to the extent that domestic and professional services are involved.

No final investigation of wages tendencies during the past twenty years was possible within the limits of the present report. It may be said, however, that the records of the Department of Labour show that there has been a continuous upward tendency since 1901, this tendency recoming pronounced in 1903, when there was a general upward movement, and in 1907, when several large bodies of employees received substantial increases. As throwing a partial light on this aspect of the question a table is appended hereto in which the wages of several classes of employees throughout Canada, in 1899 and 1909, are set forth. The data are presented without attempt at analysis, as it is hoped to add considerably to the same in future.

\section*{COMPARATIVE TABLES RELATING TO RATES OF WAGES AND HOURS OF LABOUR}
COMPARATIVE TABLE OF RATES OF WAGES AND HOURs OF LABOUR IN 1899 AND 1909.

COMPARATIVE TABLE OF RATES OF WAGES AND HOURS OF LABOUR IN 1899 AND 1909.

```

\section*{PLEASE DO NOT REMOVE} SLIPS FROM THIS POCKET

\section*{UNIVERSITY OF TORONTO} LIBRARY```

[^0]:    *For explanatory statement see pp. 10-12.

[^1]:    - The Managing Editor of Bradstrect's Journal in the Outlook for March 12, 1910.

    13722-1

[^2]:    + Publication of these statistics was begun in the February, 1910, issue of the Labour Gazette.

[^3]:    $\ddagger$ Notably, flax seed, asbestos, mica, tea (black, Indian), onions (Canada red), B.C. fir timber, and pape:.

    13722-13

[^4]:    * During the first half of 1909 the downward tendency of 1905 was continued, the gain for the year as a whole having been made during the closing months, so that the upward tendency in progress during the autumn was more pronounced than is indicated by the number for the year as a whole. It is significant also, that a larger number of articles reached their highest point during the twenty year period in 1909 than in 1907. See p. 17.

[^5]:    * The table suggested by the British Association is quoted in the Appendix, p. 442.

[^6]:    *Record from 1900 to 1909 only. † Record from 1906 to 1909 only.

[^7]:    * As prices on the whole declined from 1890 to 1896-7 and have since risen steadily, the plan uniformly followed in this review is to compare 1909 prices, first, with those of the decade 1890-99, and second, with those of the lowest year shown.

[^8]:    - Statistics from the year 1891 to 1996 are from the Year Book of Britiah Columbia, 1897. page 260. Those for the period from 189\% to 1903, were furnished by the British Columbia Canners' Association.

[^9]:    * Since the beginning of 1910 prices have rapidly advanced for all grades of sugar.

[^10]:    - Arrangements have been made for including British Columbia fir and British Columbia shingles in the list, but statistics were not ubtained in time for publication in this report.

[^11]:    - Including foods manufactured from imported raw materials.

[^12]:    - The difference in the list of commodities represented in the difierent numbers may atcount for the divergence in particular vears. A more accurate method would be to limit the comparison to the commonities which are contained in al three numbers. This, how. ever is scarcely practicable owing to the nature of many of the commodities represented in the Englioh number. The comparison as above simply proceeds upon the fact that all three numbers have been framed with the furpose of showing genoral results.

[^13]:    * Prices as quoted are taken from the files of the Winnipeg "Commercial," and of the "Manitoba Free Press," checked by local dealers. The market for barley
    was very irregular until the last few years and in some cases the quotations given are nominal as there was no tiading for long periods at a time.
    § Special prices for seed barley : not included in calculation.

[^14]:    Newnjaper quotations
    inclushing newajapem, millery' reariln and the Wimajng grain exchange records for recent yeara.
    were an far as pomible verifie I ty reourda of actual nalem.

[^19]:    *New York quotations from The Ir.m A;e.

[^20]:    * "Blaina" brand principally, though "Boars Head" and "Maple Leaf" brands are about the same. Other grades are classed as "dull" and "all bright." The line quoted is medium, being bright on one side and dull on the other.

[^21]:    *Although quoted by the pound, lead is usually sold in 100 lb . lots.

[^22]:    $\dagger$ Quotations supplied by H. S. Howland, Sons \& Co.

[^23]:    *Quotations supplied by H.S. Howland, Sons \& Co., Toronto.

[^24]:    *The consumer paying for cartage from whari at a price based on the distance to be carted. Large consumers, such as railways, cotton and sugar refinery companies

[^25]:    †Estimate furnished by The R. Laidlaw Company, Ltd., Toronto.

[^26]:    *Up to 1900 , pitch and tar were sold per barrel, but since then, while still sold in barrels, the quotations are given by the hundred pounds. This explains in part the 300 to 500 lbs . The price $\$ 2.50$ per 400 pound barrel is regarded as an average price for the decade $1890-1899$ on the authority of several large dealers.

[^27]:    * Prices are fixed usually at the beginning of the year. The high prices ruling in the closing months of 1909 were due to the scarcity of broom corn, which was suddenly felt about the first of September. § Quotations supplied by H. W. Nelson \& Sons, Toronto.

[^28]:    * As quoted by the United States Department of Commerce and labour.

[^29]:    330
